2171. Adaptek Controllers

Newsgroup: comp.sys.atari.8bit
Date: 1989-04-26 20:43:27 UTC
From: mrp@ihlpb.ATT.COM
Message-ID: <10338@ihlpb.ATT.COM>
Source record: 115827

(F.Y.I. - I have an 800XL and hope to get an ICD MIO soon.)

I saw an ad in "Computer Shopper" which raised a couple of questions:

1) Adaptek 3530 - SCSI to Tape OIC 36 ($78)
What is "Tape OIC 36" used for? Does this mean that I can do
tape back-up if I buy one of these and an ICD MIO? What devices
use "Tape OIC 36" interfaces?

2) Adaptek 4000, 4000A, and 5500 - SCSI to ST506/412 ($89, $129, & $125)
Are there any differences between these three controllers?
Please provide details if possible.

3) Adaptek 5580 - SCSI to SMD ($175)
What does SMD stand for? What devices use SMD interfaces?

AdTHANKSvance,
Marcus Prickett

Here's the REAL question: Will it run OPUS? :-)
How about floppy or hard drives?

2173. Indus GT Rumors...

Newsgroup: comp.sys.atari.8bit
Date: 1989-04-27 01:50:00 UTC
From: sac585@uxf.cso.uiuc.edu
Message-ID: <49700005@uxf.cso.uiuc.edu>
Source record: 115823

Back in 1983 when I purchased my Indus GT drive, there were rumors of potential "upgrades" for the drive, allowing such things as a complete Z80 based computer running CP/M which would hook up with some expansion connector on the Indus' circuit board. Having been out of touch with the Atari world for some time now, I was wondering if anything neat for the GT ever did materialize. Also, was any sort of technical information on the GT ever published?

Signed,
Curious.

2174. Personal (sigh) to Jean Goulet, Gil Yehuda, and Tom Madigan !

Source record: 115825

Hit 'n' now unless your name is in the header OR you want my US Mailing address for some bizarre reason...

Forgive me for putting all of this in one message, but I wanted to minimize the personal traffic in the public area.

1) Jean -

Did you get either of the two e-mail messages I sent you in reply to your "please clarify" comments about SIO and emulating the 850? One was my general comments, another was an old article I'd discovered from someone who, while working at Atari, "homegrew" and is still using today a serial interface box that outperforms the 850...

Please let me know if you got them; the mailer at Sun sent them back saying it would "keep trying for several days" after it was unable to find a machine named 'vedge' between you and myself.

2) Gil -

Glad to hear that you got, at long last, the information about file-transfer, null-modem cables, et al! What a relief!

Am fascinated with the idea of you coming to Rochester; hope I haven't MISSED it. Give me a call when you're here, if you can -- and/or try to let me know IN ADVANCE when you're GOING to be here. (See my address/phone below, in Tom M's section!)

3) Tom -

I was a bit disturbed to recently receive a second copy of your message explaining how you misplaced my address after our original phone conversation; I had answered your FIRST copy of that message, with email, several weeks/months? earlier, and since it DIDN'T BOUNCE I sort of assumed you GOT it. I guess it went to Limbo instead.

I also called your "work" phone number and left a message on whatever passes for your "answering machine" -- did you get that?

And, regardless of whether you got the info, we're sort of running into yet another complication: I am moving to an apartment, the address I gave you is still going to be my PARENTS' address, but they are going to be away for a few days as of Thursday, May 4th. If you don't get the book here by THEN, you'll have to wait til about the 10th before you have a chance at successful C.O.D. delivery. (The apartment address isn't even worth trying -- neither I nor my roommate/girlfriend ;-) will be there during the day, and the landlord would just be confused; I'm tempted to give you my WORK address and have you send it THERE. Aw,

what the heck, I'll give you ALL my addresses!)

Home, til 5/1 (and my parents' thereafter):

15 Leland Road
Rochester, NY 14617

Apartment, after 5/1:

509 Shelford Rd.
Rochester, NY 14609

Work, any dang time at all:

LVT
100 King's Highway
Suite 1400
Rochester, NY 14617

Yes, that's right, my work and parents' house are both in the same zip code.
I live CLOSE to work. Or, rather, I work close to home.

If you want phone numbers:

parents': (716) 544-5188
mine (til 5/1): (716) 342-5914 (new # after 5/1, as yet unknown)
work (receptionist): (716) 724-1111

THAT should fix ANYBODY who wants to reach me. Amen.

>this? And what is the procedure to do it.
>

There are two ways:
1) Transmit information over a serial line. You will need a serial interface
for this (850 I believe...), a cable (nul modem) and a communications
package...
2) Information interchange via magnetic media:
a) Have an IBM read Atari floppies. A program to do this seems to be
available, but I have no information as to availability/functionality
b) Have an Atari drive read/write IBM floppies. To do so you need an
enhancement for your drive plus software. Both are available from
'Happy'. I do not have their address/full name though. Read the ads
in Atari Magazines :-)))

>drive is needed.

Yes the Happy upgrade. What is involved in this? What are the odds of
totally screwing up the drive?

Also, the benifits... It clearly gives the drive greater capacity.
After the upgrade, though, is it still FULLY backward compatible?
Are there docs provided that show you how to program it? Does it
come with MS/DOS driver software? Does any Atari/Sparta/etc software
access the greater density?

For the answers to these and many other burning issues of the day,
stay tuned to COMP.SYS.ATARI.8BIT !!!

p.s. I remember someone selling a 1050 with the happy upgrade. Is
it still available? With docs/sw?

:-) Thanks. Stan

Source record: 115826

Help, I need some advice. My brother has a 130XE with a floppy drive. He is graduating from high school and perhaps going to Catholic U in D.C.. I want to get him a present that would make his 130XE useful in college. He can take a cheap B/W TV with him so he doen't need a monitor.

I don't have any idea how the computer system is set up at Catholic U. Would he want a modem to connect to the university and use their printer or would a personal printer be more useful? Recommendations on what brand and where to buy would be appreciated to. And also if anyone knows anything about how Catholic U computer system is set up.

Also, does anyone know where to buy game cartridges for the 130XE. He would like to get a milliped game.

Thanks

The KWEST [Kitchener-Waterloo Eight Sixteen Thirty-two] Atari user group,
formerly Vector-GTIA, has a separate 8-bit meeting and 16-bit meeting.
We meet monthly, have special interest groups (SIGs),
associated bulletin boards, and public domain libraries.

I am on the executive of the group
so I should be able to handle most questions or
get replies from the rest of executive.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

The group currently meets at :
DCS Course Room, Room 2009 (2nd floor)
Math & Computer Building
University of Waterloo

Next Meetings
****
8-bit - 7:00 pm, Wed May 3, 1989
16-bit (ST) - 7:00 pm, Wed May 10, 1989

Hope to see you there,
Dani Roloson
579-3695

A personal printer is almost always better than printing on a remote system, unless you are on an ethernet or something. A modem would be useful if you have access to the University mainframes. If his major involves a lot of writing, a printer would be a major help. If he is majoring in something technical that uses mainframes, a modem would probably be better.
I have been using a Panasonic KXP1091 printer for several years, and it works pretty well. This printer is no longer made, but they make similar printers. You will need a printer interface (ICD Printer Connection, MPP, ICD MIO, ICD P:R: Connection, etc.) & maybe a cable to make it work.
I currently use a SupraModem 2400 which requires an 850, MIO, P:R:, etc. to work. I have owned an Avatex modem in the past, and I would not suggest them. The SX212 might be ok, but it would be better to ask those who have them. This one doesn't necessarily need an interface.

>Also, does anyone know where to buy game cartridges for the 130XE. He would

It's a nice little printer, and you can still get them on the west coast.
BUT their new printers are nicer, and well worth the extra $40 or so. For
the extra money, you get a better paper feed system, more fonts, and a
larger buffer. At $200, they are a hard deal to beat. The ribbons are
also pretty easy to find (but expensive).

The INDUS GT CP/M upgrade is definitely a reality. I spoke recently to someone in the local ACORN (Atari Computer Owners of Rochester, New York) user group who has upgraded his drive. I hope to get more information soon so I can upgrade my INDUS to CP/M status. When I do, I'll share the information with everyone here. Maybe someone here already has that info and could post it?

(it'll seem kind of odd to be using my computer as a TERMINAL to my disk drive!!!)

If you are interested in running 80-track drives, you might check with
"Computer Service Land", in Chantilly, Va. (703-631-4949).
At an Atarifest a few years back (the first one held at Fairfax) they
were showing a Percom controller with two 3.5 inch floppy drives
attached.

The sync signal appears on pin 25 of the GTIA chip. I believe it is combined
horizontal and vertical sync, scope it if you need to know for sure.
From there it goes through a CD4050 into a summing network.

<1. I am trying to use SIO directly. I am doing this so I can do physical
< sector accessing of the disk. (I really want to do this, so don't try
< to talk me out of it.) I was successful in reading 1050 and 810 density
< disks, on both the 1050 and XF551. I haven't tried writing yet.
<
< My problem is: I get error# 138,139,144 which are device errors, NAK's
< and timeouts accessing DSDD disks on the XF551. I assumed that you
< just set the byte count from 128 to 256. Some of the data I read
< might have been right, but with all the trash it was hard to tell. I
< tried setting the byte count back to 128, but the symptoms were the
< same. I turned the drive off and back on again, and got the same.
< Apparently, there is something different you must do when accessing DD
< disks.
<
From all i've heard about it I assume that the XF551 switches to the
appropriate density when you insert single, double, or enhanced density
disks. It does not, however, switch to double sided mode on its own,
you need to send it a configuration command to do so.
Are you familiar with the commands to change drive configuration? If not
I could send you some info.

> ... read sectors 1,2,3
>of an Atari disk (which, by the way, Atari keeps in SD. Question 1.
>Is that done by software in the computer, or by the drive itself?)

The sectors on the disk are actually 256 byte double density sectors.
The drive only transfers the first 128 bytes from/to the computer.

>
>As I recall, when I used Spartados DSDD XF551, it seems those sectors
>may have been formatted DD because it took a couple "tries" before
>a DD would boot. Question 2. Does anybody know?
>
I think these problems are related to the drive not recognizing (at least not
until it gets several errors) that the disk is double sided.

>Finally. I still can't read PC-DOS disks. Are they in 256-byte sectors?

No, 9 512 byte sectors per track.
A slight additional complication is the fact that all Atari formats write
the complement of the data to disk.

>(about) twice as long... This should answer your third question...

This is not quite accurate. The PC (and most other reasonable disks) start
a track at the index mark, write the required number of sectors (with all
the appropriate headers and gaps), and then write a gap until they encounter
the index mark again. The 1050 does not use the index mark, and therefore
must use a different approach to ensure that the track does not contain
unwanted sector headers: It writes a very long gap (about 1/4 track, I
think), then all the sectors, and then stops immediately. Most of the
long gap gets overwritten.
The resulting track format is almost identical, and most disk drives /
controllers / software drivers can read disks formated by either method
equally well.

RE: XF551 & Spartados, etc

The XF551 when first turned on pretends that it is a single sided single density (SSSS) disk. IT doesn't care what disk you put it, it retains that configuration until the computer access the drive; at that time, it reconfigures for the correct type of disk that is inserted. Unfortunately, SpartaDos thinks the drive is still SSSS when actually it is a DSDD disk. This causes the boot error, but if you hit reset it will boot correctly. This may even happen with DOS XE, but since I can't see a reason to use it, I don't know for sure.

Will you be doing it over phone lines or direct computer-to-computer? If it is direct, you can use standard terminal programs w/ text send/capture as the protocol (the RS232 interface (if you have one) will translate the Atari newlines to ASCII carriage returns). I'm also assuming you have a null modem cable to hook up the two computers (if you ask, "What is a null modem cable" you probably don't have one, in which case, you will have to refer to somebody more hardware-oriented on the net about the specifics). If you are doing it over phone lines, you can use:
1) Text send/capture like before, but if random characters seep in, they won't be caught.
2) Kermit 65, or another program that can transfer in kermit's ASCII (text?) mode (assuming the PC can do kermit in the first place).
3) Xmodem, ymodem, etc., but you should translate the ATASCII newlines to ASCII CR's before transferring. A good word processing prog, a public domain ATASCII to ASCII translator, or even a program you write yourself will do the trick.

Allow me to confirm it. We keep back issues of all three magazines on
the terminator Atari archive. Check the files zmag.arc, streport.arc
and stzmag.arc. As soon as I get a bit more organized, I'll put them
in their own directory.

Sorry to but in on this otherwise serious notes group with a request for a game hint, but this has been bugging me for a while and just maybe somebody can help me out. Has anyone solved MONTEZUMA'S REVENGE? I have gotten to what I believe is the end. There's a giant guy stomping and everytime he does the screen shakes. This is so much unlike every other screen that I've got to assume that it's the last screen.

Source record: 115851

Addressed to everyone on the net to see if they've heard this
one too; but mostly addressed to the folks at Atari...I'd like
to have this either confirmed or denied please.

I've heard the following rumour on several BBS' the past week or
two, and today had someone who usually only passes along rumours
which he has the inside scoop on tell me about it again. The rumour
is that Atari has officially dropped the 8-bit line of computers.
All production and support for the XE line has been cancelled...
computers and peripherals both. The only 8-bit product not completely
dropped is the XEGS, and that is being sold to Atari Games.

So what's the deal? Has everyone here in NJ lost their minds, or is
this (SAY IT ISN'T SO) unfortunately true?

I also would love to get my hands on an EMACS like editor. I typically
use Textpro to edit files, but it is more a word processor than a program
editor and the word processing features can sometimes get in the way
(for example, the program always has word wrap on, so when I get into
it I have to hit ctrl-y [I think] to turn it off).

I know I should have posted this long ago, but...

The Michigan Atari Computer Enthusiasts presents the MACE Expo,
May 6 and 7 at the Detroit Metro Airport Hilton Hotel.

Representatives from Atari US and Atari Canada will be there, along with
regional Atari dealer representatives and Atari MIDI reps.

Among the exhibitors (that I can remember) are WordPerfect Corp.,
Alpha Systems, ICD Inc., CodeHead Software, DataQue, Gribnif, TimeWorks
and more..

DataQue is planning on showing the Turbo 8-16 accellerator board for the
8-bit Atari systems and Bob Puff (creator of SuperUnArc among others) will
hopefully be displaying his "Black Box" Super Interface for the 8-bit,
for the first time.

Darek Mihocka will be introducing his last version of the ST-Xformer 8-bit
emulator for the ST at the show.

Seminars are planned on a wide variety of subjects, presented by representativ
from many of the companies in attendance.

Admission is $5.00 for both days, and the seminars are free.

The show will be open from 10AM to 6PM on Saturday, and 10AM to 5PM Sunday.

The Hilton Hotel is offering a special rate of only $55 per room, and
there will be drawings for doorprizes throughout the day. One vendor is
holding a special drawing for an ST system...

The show is user group oriented, with special discounts offered by vendors
for user group members, and many user groups will have booths set up
offering memberships in their groups. Any user groups who are interested
in having a FREE booth at the show should call for information.

The MACE Expo "hotline" for information is: (313) 973-8825

The following message is being posted for Dennis Beach, who doesn't have write access to the net at this time.. Please don't Reply to this message; rather, mail him using the address at the bottom of the message. (even though I'll gladly forward any messages I receive to him)..

Curious,

Yes, the Indus rumors you have heard are perfectly correct. I bought the upgrade to bring its memory to 64K. I also have tech notes for the drive which include the whole operating system source code! I have had lots of fun with it. After looking through the tech notes, it looked possible to read a whole track in at a time and write it back (it would make quite a copy program). I was able to read the whole track (including inter-sector info), but could not get it written back properly. The 64K board plugs right into the main board (nothing but a screwdriver necessary). I ordered mine from a mail-order place called "black patch systems" which I found in Antic magazine. The tech notes I recieved when I bought the Indus used from a good friend. One more thing, Indus has been bought out or something and the company is named "Future Systems". The address/phone is:

Future Systems, Inc.
9811 Owensmouth Avenue, Suite 9

You're right Hans! But the point I tried to make in my article was to tell
Stan that it is not possible to control such features by modifying software
in the Atari. To do so, the software in the drive must be re-written.
Thanks for your reaction though.. I have learnt something :-)))

To Mike McPeak:
It's in the mail, rate same as US, $5. If you don't like it just return it.

To the newsgroup:
Sorry to reply on the net etc, but you know how it is. Gee if I'd known there'd be so much interest in my editor I'd have charged more. :-) I was thinking about expanding its file access mode to do all dup.sys does, and having it live under the basic rom, accessed through the DOS command. Worthwhile? Then I WOULD charge more. :-)

2205. ACTION! Run-time disk...

Newsgroup: comp.sys.atari.8bit
Date: 1989-05-01 17:16:00 UTC
From: ACSCHW@SEMASSU.BITNET
Message-ID: <8905011930.AA09972@ucbvax.Berkeley.EDU>
Source record: 115859

Hello fello Atari-enthusiats,

I just recently bought ACTION! and found out (as I had figured) that even though ACTION! is compiled, without a Run-Time library (which can be licensed through OSS) disk version, the ACTION! cartridge is required to run ACTION! programs.

Well, I would like to be able to share a few utils I'm making between me and anyone who wants them. Therefore I'm asking if anyone out there has this disk version of the run-time library for ACTION!. I believe it has been distributed on some of the ANALOG disk subscription disks (around issue 50 probably).

Also, if anyone is interested, the utils are going to be for translating between diferent machine language forms. I.E Boot disk to Binary Load File converter. (This can be used on old non protected single stage boot disks to make them into files you can load with dos's L option)

Thanks,

I don't know of any, and don't think there are any either (this question has been asked here before).

Some games work well with the trakball in joystick mode anyway; like millipede and actually MC ain't bad. Even tried it on the 2600 MC. Trakball is pretty useless in some games, though, like pacman.

I use the commodore mouse now for a lot of this stuff, which works pretty good in joystick mode, after my trakball started sticking. (I was using the tb as a mouse in some of my programs, but I need two buttons anyway). (I gave up trying to get the mouse to run in proportional mode, too; it is read through the pot inputs, and for some reason works on a commodore but not on an atari.)

2211. Help needed accessing Xanadu

Newsgroup: comp.sys.atari.8bit
Date: 1989-05-03 19:32:37 UTC
From: slackey@bbn.com
Message-ID: <39437@bbn.COM>
Source record: 115865

There has been some communication going on regarding ways to send files between Atari 8bit and PC's. I am told that there is an existing program, called UTIL.COM, which runs on a PC and allows the PC to read/write floppies in Atari format (either 128 byte sector/1050/DOS 2.5, or 256 byte sector/XF551/DOSXE or SpartaDOS compatible I hope!).

The message goes on to say that the program is down-loadable from the Xanadu BBS. Now I for one have not the hardware, software, nor knowledge to allow me to get it myself.

There are a number of people in my situation who would like this program, but for some reason can't get it in the straightforward way. If some kind soul would do the legwork and mail me a working copy, I would 1) reimburse you for any ***COSTS*** incurred, and 2) organize a method for copying and distributing it to the interested parties.

Lisa Raine asks about the Atari Portfolio...

(Regarding its use for the handicapped, and my reply that it wouldn't be suitable..)

>Bob, why not? With a little help from canada who has come up
>with a speech synthesizer about the same size as the folio,
>why wouldn't it work?

That's the problem... the "Atari" Portfolio is a toy computer which is only being marketed by Atari... they had nothing to do with its development, and as far as I know, nothing to do with its manufacture.. they're just slapping an Atari label on it...

The Portfolio has no standard interfaces or "ports" on it, so any devices like speech synthesizers which needed an RS-232 interface, would be useless..

There are no "internal card slots" to use standard IBM PC style expansion cards (actually, that's understandable, given the compact size), so that avenue of expansion is closed..

There is no provision for attaching any standard printers or disk drives...

There is virtually *NO* software available for it, despite the fact that it will *RUN* any MS-DOS programs, because of the "RAM-Card" storage device.. (try an experiment... call any IBM software store, and ask them how many IBM programs they have... then ask them how many of those are available *now* on "RAM-Cards"... if they're polite, they'll wait until after they hang up before they laugh..)

There *IS* built-in software provided with the Portfolio... anyone who plans to use a "Lotus 1-2-3" spreadsheet clone with an 8-line by 40 character display, raise their hands... I didn't think so...

There is a "wordprocessor" built-in, but with no printer support, and no disk drives to easily port your documents (again, typed on an 8-line by 40 character display), it's nothing but an electronic "notepad"...

Supposedly you'll be able to buy a "RAM-Card drive" to attach to a "real" computer so that you can transfer data from the Portfolio to a more capable machine for printing or whatever.. add the cost of that to the Portfolio's original cost...

There *is* a 60 pin connector on the back of the Portfolio which could theoretically be used to go to a serial/parallel port adapter, but none are currently available, and unless Atari manages to sell an awful lot of Portfolios, I don't expect to see much in the way of this kind of

peripherial...

In short, Atari has found a convenient "short term profit" vehicle, which has the added advantage of attracting a lot of Press coverage because it has the "magic word," MS-DOS attached to it...

I expect to see the Atari Portfolio a year from now, if indeed we see it at all, in Perry Drug Stores, right next to the Timex/Sinclair 1000... or given away free with every air-conditioner from Crazy Fred's appliance store, like the Atari/Hartech calculators...

To get back to Lisa's original question... by the time you'd add all the things missing from the Portfolio, you'd have a monstrosity that would be twice as big and expensive, and far more bulky, than a "real" computer that had all those features built-in...

The Portfolio sounds nice when you read the publicity releases.. but take a closer look before getting your hopes up...

> [Criticisms of the Atari Portfolio by BobR deleted]

Just two things I want to say about this whole thing:

(1) I believe IBM already has a similar "portfolio" device out. It's an in-house package, manufactured specifically for them by Motorola, I believe. I saw a friend with one the other day and caught a few tidbits about it. If it's that popular, it might be more useful than Bob suspects.

(2) What's wrong with Atari slapping an Atari lable on third-party developments? Does it TRULY make a difference if the SM194 19" monitor is made by Moniterm instead of Atari? Do I really care that Atari only licensed WordFlair from another developer? In the end, all this adds up to is more Atari support/product development, and isn't this what we were arguing for in the first place?

1989 looks like a nice year for Atari -- now if only they can get some BIG advertising done... (Yes, I'm waiting for the Atari response to Apple's "1984" commercial)

THIS IS IN RESPONSE TO BOB RETELLE'S RATHER ONE-SIDED POSTING RE PORTFOLIO:

in article <17909@cup.portal.com>, Bob_BobR_Retelle@cup.portal.com says:
>
> ... the "Atari" Portfolio is a toy computer which is only
> being marketed by Atari... they had nothing to do with its development,
> and as far as I know, nothing to do with its manufacture.. they're just
> slapping an Atari label on it...

1) It is most certainly NOT a toy - not when some large companies show
interest in buying large quantities for internal use.
2) Atari has been VERY closely involved in development - all packaging and
production engineering has been done by Atari/Japan. Design eng'g
and software features have also be with Atari's full participation.
3) Atari is solely responsible for its manufacture.
>
> The Portfolio has no standard interfaces or "ports" on it, so any devices
> like speech synthesizers which needed an RS-232 interface, would be useless..

Portfolio has a very flexible "bus-style" connector, making it easy to
develop customized dumb or intelligent cables for all manner of expansion
possibilities, and not just slow RS232. Indeed, Atari is developing several
such options.
>
> There are no "internal card slots" to use standard IBM PC style expansion
> cards (actually, that's understandable, given the compact size), so that
> avenue of expansion is closed..

One of the interface cables will allow direct connection to a PC Bus.
>
> There is no provision for attaching any standard printers or disk drives...

See comments re cables interface above.
>
> There is virtually *NO* software available for it, despite the fact that it
> will *RUN* any MS-DOS programs, because of the "RAM-Card" storage device..
> (try an experiment... call any IBM software store, and ask them how many IBM
> programs they have... then ask them how many of those are available *now* on
> "RAM-Cards"... if they're polite, they'll wait until after they hang up
> before they laugh..)

But how many, subject to copyright issues, could be downloaded via the
intelligent cable into the battery-backed RAM card? And some packages have
a license which allows you to have copies on more than one system provided
you only use one of them at a time. Of course, some users might just like to

develop their own programs and download them - no copyright problems at all!
>
> There *IS* built-in software provided with the Portfolio... anyone who plans
> to use a "Lotus 1-2-3" spreadsheet clone with an 8-line by 40 character
> display, raise their hands... I didn't think so...

Sure beats a pencil (and eraser!!), calculator and pocket notebook!
>
> There is a "wordprocessor" built-in, but with no printer support, and no
> disk drives to easily port your documents (again, typed on an 8-line by
> 40 character display), it's nothing but an electronic "notepad"...

See previous comments re connectability etc.
>
> Supposedly you'll be able to buy a "RAM-Card drive" to attach to a "real"
> computer so that you can transfer data from the Portfolio to a more capable
> machine for printing or whatever.. add the cost of that to the Portfolio's
> original cost...

.... which is a remarkably low entry-level price in the first place - about
equal to the sales tax on a full blown system?.
>
> There *is* a 60 pin connector on the back of the Portfolio which could
> theoretically be used to go to a serial/parallel port adapter, but none
> are currently available, and unless Atari manages to sell an awful lot
> of Portfolios, I don't expect to see much in the way of this kind of
> peripherial...

See above.
>
> In short, Atari has found a convenient "short term profit" vehicle, which
> has the added advantage of attracting a lot of Press coverage because it
> has the "magic word," MS-DOS attached to it...

Not to mention attracting a lot of potential buyer coverage.
>
> I expect to see the Atari Portfolio a year from now, if indeed we see it
> at all, in Perry Drug Stores, right next to the Timex/Sinclair 1000...
> or given away free with every air-conditioner from Crazy Fred's appliance
> store, like the Atari/Hartech calculators...

You certainly will see it a year from now. You'll also see it a lot sooner,
provided your eyes (and mind?) are open.
>
> To get back to Lisa's original question... by the time you'd add all the
> things missing from the Portfolio, you'd have a monstrosity that would be
> twice as big and expensive, and far more bulky, than a "real" computer
> that had all those features built-in...

Of course, a "real" computer probably wouldn't weigh a pound or so and
fit in a normal briefcase, purse etc. And the size/cost estimates are wildly
imaginative!

>
> The Portfolio sounds nice when you read the publicity releases.. but take
> a closer look before getting your hopes up...

... and then you'll see that publicity releases, press articles, and word of mouth just can't do it justice - it's even better!

Hi, guys! It's me and my stupid PC-to-Atari trash again!

Well, if you want to read more than this drivel, post something!

Chris Chiesa sent me a program via Email that looked like it indeed initialized a disk, then transferred PC files to Atari format. Only problem was it was Mydos format, which I don't know from a hole in the ground. So, I put some ascii files on the disk and will attempt to reverse-engineer Mydos format over the weekend. Also, it seems to only understand only non-XF551 drives. (A Percom one and the ATR8000 or something like that?) I wrote using the default (I don't even know which one it picked) and will attempt to read on the XF551. When I took a directory, it looked like it gave back the starting sector and the number of sectors. I will start with that.

Wish me luck (or send me information on the Mydos format!) (Or both.)
-Stan

In the end, it adds up to more Atari licensing and more of the Not Invented
Here syndrome. Broken SM194s will probably end up at Moniterm service
centers. WordFlair bugs will take a long time to fix, if they are fixed
at all (I hope they didn't buy only the BINARIES this time; remember
Write. What about Ultrascript).

I wish atari would focus some development in two areas: redesigning the
Laser Printer smaller, nicer looking, and easier to change parts; and
a better font system for GDOS, maybe a combination outline/bitmap.
Oh yeah, it would be nice to see those TOS 1.4 roms before Bush is out
of the white house.

As far as I can tell, the Mydos format is upward compatible with the Atari SSDD format. I can say for sure that the program works for me on my 800XL and Indus GT, and both OSS DOS XL and Smart DOS have absolutely no trouble reading the disks written on my 360K standard IBM drives.

2223. PC portfolio

Newsgroup: comp.sys.atari.8bit

It seems that we have a Mr. Downer leaving his impressions on a computer (the PC Folio) that he has not even used (so it seems) and bases the future of the computer on the performance of a much less capable system (Timex Sinclair 1000)

I would rather read news and comments about a system *after* they have tried it, not *guess* what the capabilites are before they even see it.

He forgets *completely* at what segment of the market the PC Portfolio is aimed at. It is not a replacement for a desktop system! It was never meant to replace your PCx! It is (in my opinion) a supplement to your system, be it a PCx or ST.

I work at an electronics store (the good guys!) and we sell quite a few of the Sharp Wizards. Now if you've ever seen them, they are practically computers, using ROM/RAMCards for programs and information storage. I have mentioned the PC Portfolio to a few customers, and the interest is there (Atari, are you listening? Talk to our buyers!! The malcontent moans about the method to connect it to PCs. Heck, I have customers asking me every other week if we have the PC Link cable/software interface for the Sharp Wizard to connect to a PC or a Macintosh!

Listen, if you could carry a computer in your pocket, rather than taking up all the room in your briefcase, wouldn't you rather have the Portfolio? Again, I have business customers that come back, and mention about the Sharp Wizard being more convienent than carrying around those book-like organizers. And the Portfolio is certainly more convienent than a briefcase-size computer.

I was glad to see someone at Atari speak up for the Portfolio. Of course he has the better information, and I think he answered the percieved criticisms of the computer.

If someone really has a PC program to write to Atari disks,
could they please post it?

One was posted to the net a few months ago, but my attempts to
uudecode and then decompress it do not reproduce the file correctly
(I could tell by looking at some of the text messages; besides, it won't run).

I would like a version that is ARC'd and then uuencoded.

I have an XF551, and Indus, and a Rana.
I can use DOS 2.0, DOS 2.5, DOS XL, and SmartDOS.
I keep hoping that I can find *something* to write on Atari disks from a PC.

Note: The recent note that the desired program was on the Xanadu BBS
produced frustrating results. I could not find such a program;
they only allow downloads after you have done an upload;
they do not accept uploads which are already on other local BBSes;
and they prefer text uploads, as opposed to programs.
This adds up to a very small chance of getting what I want from
Xanadu, if it even exists there at all. Arghh.

Responding to comments on my posting about the Atari Portfolio...

I'd expected that they would stir up a bit of controversy, but remember,
I was replying to a specific question about the applicability of the
Portfolio that was posed by a woman who is handicapped, and whose hopes
had been raised by the press coverage of the machine.

Effectively, my reply is substantiated by the points in Roy Good's reply..

For Lisa Raine, the Portfolio would not be a good choice.

There is no provision for using *standard, currently available* RS-232
or parallel port devices. Atari has these "under development" for release
some time in the future.

There is no (or little) software *currently available* on RAM-cards. Perhaps
companies will release software on this non-standare format some time in
the future.

Software might also be downloaded to the Portfolio using a direct connect
cable from a PC, or by modem, using cables to be released some time in the
future.

Work done on the Portfolio could be transferred to a PC by using the
"RAM-card" drive to be released some time in the future.

In all cases, the operative phrase is "some time in the future"...
when the Portfolio is released, it will be a computer... NOT a computer
SYSTEM...

This may be fine for some needs, and if large companies are interested in
buying Portfolios in quantities, that's great... but for people like Lisa,
who need a complete, working computer system, the Portfolio is not the
answer.

It may indeed be that it was never intended to fill the need for a portable
system, and that used properly in its own niche, it may be a great success..
my objection is that all the press hype of recent months has been trumpeting
the Portfolio's "MS-DOS compatibility" without going on to tell the rest
of the story about how limited the basic machine will be.

Generating lots of "potential buyers" is only good if those buyers find that
they can do something useful with the computer when they get it home.
An awfully large number of people were soured on personal computers when they
bought the Timex 1000, then discovered there was little they could really
do with it. I hope the Portfolio doesn't repeat the same history.

I'd love to see Atari have a big hit on its hands... I just don't think the Portfolio is it... maybe I'm wrong, and I'll log in next year at this time on mine to admit it..

Mark Newton-John had a few comments about my assesment of the Atari Portfolio (which were contained in an answer to a question about the capabilities of the machine).

Of course I haven't used the Portfolio yet. My comments are based on the Press coverage the machine has been getting. This coverage, from the information released by Atari, has been playing up the MS-DOS compatibility without also covering the limitations.

Far from forgetting the market the Portfolio *should* be targeted for, I'm well aware of what that market should be. The Portfolio could be thought of as a "peripherial" for an existing PC system, for use by salesmen in the field, for transporting files between work and home PCs, and as a compact "electronic notepad" that's easily transportable.

Unfortunately, so far, that is NOT the impression being given to the public. We'll have to wait and see if Atari defines the marketplace for the Portfolio, or tries to sell it as a general purpose computer.

(Incidentally, I think that the Portfolio is quite a technical accomplishment in reducing a 640K PC compatible system to such a small size. If it could be released along with the interfaces needed to connect it to the outside world, along with software in its RAM-card format, it could be quite a successful computer *in its own niche*.)

2232. Speech Synthesis Circuit

Newsgroup: comp.sys.atari.8bit
Date: 1989-05-15 08:50:13 UTC
From: RCH@cup.portal.com
Message-ID: <18383@cup.portal.com>
Source record: 115886

On a closeout at Radio Shack, I purchased the two speech synthesis circuits (SP0256 Narroator Speech Processor and CTS256A-AL2 Code-to-speech Processing Chip) commonly used to build speech synth units for small computer applications. I got the chips both for under $10, and now I need to build the unit.

The April 1985 Analog magazine has a project for building a unit that plugs into the Atari 800/XL/XE's joystick ports 0&1. It is a good hardware article, but I have seen somewhere a design for a circuit that uses the RS-232 port instead. Does anyone know where I could find this project?

My idea is to hook the unit up with a y-cable to my modem, and have it speak the text it receives while BBSing and chatting. Heard of any Atari app's for this?

Thanks for any reponse!

NOT SO, Acorn Computers Ltd. are still alive and kicking very well indeed.
They have very healthy profits in the UK and have just announced an upgrade
to the BEST RISC based personal computer: Archimedes 3000, 3-4Mips+, 1mbyte mem.
800k floppy etc for less than UK pounds 1000.00.
They are also still actively supporting the BBC B/Master computer in the
educational & domestic market, with 3 full colour monthly magazines devoted
to their products.(Acorn User, A&B Computing , ?? third name slips my mind now)
contact Acorn Computers Ltd, Fulbourn Road Cherry Hinton, Cambridge CB1 4JN,
England for sales and support contacts.
There is also an active news feed in Europe for comp.sys.Acorn why not get
your administrator to check on getting a feed to USA?

I have no commercial connection with Acorn Computers Ltd, just dont like
to see a good company written off because they are not pushing in the US
marketplace, its very difficult for European firms to get started in the US
as you have very well established domestic suppliers- a lot of firms have been
burned in attempting to get started there.
If you need further info please post your specific requests and I will try adn
get the info/contacts you need.

[]

Hey,

Does anyone know where I can get some prints to an Indus GT disk drive?

It seems to initialize fine, but the 65XE doesn't see it when you turn on the 65.

The serial port seems to work, (you can print to the 1025), so it is looking like the drive.

BTW, since nobody responded to my question about printing graphics screens on the 1025, I guess it cannot be done?

Thanks - devoz

Just thought I'd pass along this worthwhile info for those of
you who may have missed the article in Zmag a couple weeks ago...

A new organization headed up by Marty Albert is trying to provide
new, quality software to Atari 8-bitters. MAX Systems is currently
searching for programs written for the 8-bits. Anyone who has written
anything (games, applications, utilities, etc) for the 8-bit that
they think is fairly good is strongly encouraged to contact MAX
about the possibility of marketing the program (their royalty
rate is VERY attractive). For more information about submitting
programs to them, or about available software just send an SASE to

MAX Systems

2237. Re: Speech Synthesis Circuit

Newsgroup: comp.sys.atari.8bit
Date: 1989-05-16 13:41:22 UTC
From: cfchiesa@bsu-cs.bsu.edu
Message-ID: <7222@bsu-cs.bsu.edu>
Source record: 115891

In article <18383@cup.portal.com>, RCH@cup.portal.com (Ric C Helton) writes
(severely paraphrased here):

> [...] (I) purchased two speech synthesis circuits [...]
> [...] now I need to build the unit.
> [...] I have seen somewhere a design for
> a circuit that uses the RS-232 port [...]
>
> My idea is to hook the unit up with a y-cable to my modem, and
> have it speak the text it receives while BBSing and chatting.
> Heard of any Atari app's for this?
>

This reminds me of something I did several years ago in BASIC. I typed in the
little "terminal emulator" program provided in the 850 Interface Technical
Manual, and added a few lines so that text received from the modem line would
be spoken by "S.A.M." - that's the Software Automated Mouth speech synthesis
thing that came out in the early 80's... With very little work on my part, I
had a "talking" terminal that would read me whatever came up on the screen.
It was INVALUABLE for reading E-mail, as I could walk around my apartment, make
lunch, etc., WHILE "READING" MY MAIL!

S.A.M.'s only limitation was that it required a "pause" to process a line of
text before speaking it -- so I implemented an automatic XON/XOFF to halt
host transmission while S.A.M. was speaking, and it thereafter worked fine
once you got used to the "gaps" in speech, S.A.M.'s rather oddly accented
speech, etc. etc...

A "S.A.M. handler" later appeared which allowed text to be PRINTed to a "V:"
(for Voice, I imagine) device whereupon S.A.M. spoke it -- that was a little
"cleaner" than the X=USR(...) call that I had to use.

If anyone is interested in developing this old chestnut, I might be able to
dig it up somewhere...

The beeb is alive and well, there is a great following for it in
the UK, lots of suppliers are supporting it and there is a lot of software
availlable together with manuals and lots of add-on goodies, there are
also two magazines which support the beeb as well as several user clubs.

I am a user, but mainly for word-processing and other domestic problems,
if I can help with any specific questions, please mail me.

If you would like a copy of one or both of the magazines please mail
me an address to send it (them).

This is my third attempt to send you a message regarding the beeb,
I hope this one is successful!!

From: lanzki@infoac.rmi.de
Message-ID: <475@infoac.rmi.de>
Source record: 115894

Hi,

now I got a null-modem-cable between the ST and the 800XL without
using the 850 interface. The ST is connected direct to the 800XL
system-bus (19200 Bd).

I want to use the ST as one or two RAM-disks for the XL. Maybe I
include a printer-buffer, if the printer is connected to the ST.

But I need some info's to realize the project.

How is the data-exchange done between the XL and a 1050 drive , printer ?
Commands used ? Data format ? Checksum ?

I want to boot the DOS from D1 and then the ST should respond like D2
and/or D3.

Any help is appreciated... thanks in advance...

Look at the ads in magazines like Analog Computing, Antic, and Atari Explorer. (One or more of these are usually available in some bookstores.) I know there is some educational s/w out there (although I don't know specifics) and at least some of it must be available by mail order. Also, is there an Atari user's group in your area? If so, check with those people.

> I also need a backpup storage device. What do I need to connect a cassette

Given that you will be buying software for your son's XE, you would be better off with a disk drive than a cassette. There is relatively little s/w available on cassette anymore. Also, cassettes are slow and not as reliable.

In digging around in old Antic mags, I found details for a WEFAX
weather map receiver project... You receive the radio fax signal
with a radio-modem, and view the weather maps on the screen or
print them out.

I have a couple of questions from people who built the interface... like
what was your total cost (shortwave receiver, modem, parts, etc),
what problems did you encounter receiving the fax signals, etc?
Are there many things sent fax now? The article mentions AP photos
and the like being sent on certain frequencies at various times....
Thanks for email or net replies!

2247. Analog source

Newsgroup: comp.sys.atari.8bit
Date: 1989-05-21 22:14:49 UTC
From: jean@maxwell.Concordia.CA
Message-ID: <819@clyde.Concordia.CA>
Source record: 115901

This is partially in response to one inquiry from soneone in Germany asking about 8-bit/ST communications. There was a 3-part series in Analog magazine that showed how to make a programmable printer interface by using an extra 8-bit computer. Most of the articles talk about how serial I/O is done on the atari, and there is enough info in there to figure out how to use an extra computer as a ramdisk. The articles are by Lee Brilliant in issues 59,60, and 62 of Analog magazine under the Bits & Pieces column (under the title Zucchini - stupid name, but good articles).

My concern is that they screwed up on the Mac/65 source listing (the last part was left out), and I need it. So: Does anyone have the file ZUCCHINI.M65? I would appreciate it if it was posted here, or emailed to me (although the fellow in Germany will probably need it too). The file is on the disk for Analog #62 (July 88).

If I can return the favor in any way, let me know. Thanks in advance.

2248. atari8f archive

Newsgroup: comp.sys.atari.8bit
Date: 1989-05-22 08:30:00 UTC
From: ATKIN@GRIN1.BITNET
Message-ID: <19890522142658.9.JRD@MOA.SCRC.Symbolics.COM>
Source record: 115902

[This message has been redirected:
info-atari8@score.stanford.edu has been added.]

THE BITNET ARCHIVE FOR 8-BIT ATARI SOFTWARE IS OPERATIONAL !

Sound familiar? Well, here's the important bit--

AND THERE ARE ACTUALLY FILES THERE !

Yes, almost everything that's supposed to be there has now been stored.
This means that anyone who can send mail to bitnet can now get copies
of Super-UnArc, YAU, Kermit-65, the GOE demo, and lots of other files
that have long been available on the Internet archive. (However, people
with FTP access to the Internet archive should use it instead of the
Bitnet archive, for traffic load reasons.)

The Bitnet archive consists of a bunch of files managed by a list server
at Bitnet node TCSVM (Tulane University---thanks guys!). To get files,
a directory of the files, or whatever, you send a command to the LISTSERV
program (daemon, server, whatever.) Commands can be sent to listserv in
three basic ways: interactive messages, mail, and non-mail files.

If you are directly connected to bitnet and your system supports them,
interactive messages are the easiest way to send a command to listserv.
The command to send an interactive message is:
"TELL LISTSERV AT TCSVM" on VM/SP systems,
"TRANSMIT TCSVM.LISTSERV NOPROLOG" on MVS systems with TSO/E,
"TO LISTSERV@TCSVM" on some JES2 systems (you might have to
use "VMSG" or "XMSG" instead of "TO")
"SEND LISTSERV@TCSVM" on VAX/VMS systems.
Then type the listserv command as the text of the message.

If you can't use interactive messages, you can probably use mail. The
command to send a mail message (as if you don't know) is:
"NOTE LISTSERV AT TCSVM" on (all) VM systems, or
"MAIL LISTSERV@TCSVM" on VM systems with a Crosswell mailer,
"TELL LISTSERV@TCSVM" on VAX/VMS systems.
Most other systems have a mail facility, but I don't know all the commands.
PROFS users can send PROFS mail, but it must be send as MAIL, not DOCUMENT.
Anyway, type the listserv command (on one line) as the mail message.

If neither of these work, you'll have to resort to (non-mail) file
transmission. Prepare a file in advance containing the listserv command(s)
(one per line). The command to send the file to listserv is:
"SENDFILE filename filetype TO LISTSERV AT TCSVM" on VM systems,
"TRANSMIT TCSVM.LISTSERV DATASET(dsname)" on MVS systems,
"SEND/FILE filespec LISTSERV@TCSVM" on VAX/VMS systems.

Okay, now that you know how to send a command to the list server, you're probably wondering what the commands look like. There are two commands you're probably interested in:
INDEX ATARI8-F
will cause the server to mail/send you the directory of files that it knows about. Note that there may be a few files listed that haven't yet been stored there. (Don't ask.) Such files can be identified by the presence of dots where the file length and modification time should be. The other command:
GET filename filetype ATARI8-F
will cause the server to mail/send you a copy of the named file. Note that there is a space (not a period, not a slash, a SPACE) between the name and the type. You should hear back from the server within a day or two, assuming all links between you and it are up, so don't send the same commands repeatedly. If you use interactive messages, the server will acknowledge your command with an interactive message and then mail/send you the file.

For example, if you're on a VAX/VMS system (running JNET), after typing
SEND LISTSERV@TCSVM GET SUPUNARC UUE
you should see a message from the server like "file supunarc uue sent to you" and eventually a system message like "received network file supunarc.uue" indicating that it arrived.

Questions or problems should be sent to John Dunning (jrd@stony-brook.scrc.symbolics.com) as I am graduating tomorrow to join the ranks of the unemployed, and won't be able to spend much time making long-distance phone calls to my alma matter's computer.

Geoffrey Atkin, atkin@grin1.bitnet or [72337,3414] on Compu$serve.

2249. Cassete to Disk

Newsgroup: comp.sys.atari.8bit

Lots of other stuff deleted...

Anyway, can these operations (getting a directory, getting files)
be done on usenet from a Sun3 network? If so, how?

2251. Reply to "alaa@pedsga"'s posting of last week or so...

Newsgroup: comp.sys.atari.8bit
Date: 1989-05-22 20:56:13 UTC
From: cfchiesa@bsu-cs.bsu.edu
Message-ID: <7361@bsu-cs.bsu.edu>
Source record: 115655

Sometime last week, 'alaa@pedsga' posted the following request for information:
>
> I need some maths/educational software for my son's Atari XE,
> does anyone know of mail order magazines/catlogues that carry this stuff.
> I also need a backpup storage device. What do I need to connect a cassette
> player to this system, and would any cassete player do or would I need a
> special one?

As so often happens, the E-mail I tried to send in response BOUNCED -- some system out there can't find "pedsga" and MY system doesn't turn it up on a 'findhost' command so I can't try any alternate mail paths... I don't even have a copy of the original posting and don't know the original poster's real name. I do hope he/she is reading this... the rest of you, hit 'n' now; 'alaa', whomever you are, READ ON please!

MY ORIGINAL REPLY, FROM 5/19:

I don't know of a catalogue, per se, but you can try looking in the back of nearly any issue of "ANTIC" magazine -- which should be easily found on the rack nearly anywhere with a decent selection of magazines. (Try college book-store, Waldenbooks or B.Dalton bookstores; heck, around here, I get 'em at the GROCERY or DRUG store.)

As for math/educational software, HOW OLD is your son? I recently bought a "package deal" Atari system that came with a lot of cartridge software that I am NEVER, EVER going to use... if your son is in the first or second grade, (my opinion; the labels/instructions may be more specific) perhaps you might be interested in one or more of these, and we could work something out. I'd like to get about $10 per cartridge but that's a BARGAIN compared to anywhere else... Of course, these games are pretty unsophisticated and a bit "dumb" in my opinion, but then, I'm not a first-grade child either... ;-)

Lastly, the "Atari 1010 Program Recorder" is Atari's own cassette drive unit. You could probably find this item listed, as is true with nearly everything available for the Atari, in the back of ANTIC... It is a "newer" model than the older "Atari 410 Program Recorder." I have a 410 myself, and could probably be convinced to part with it for about $20 as I never use it.

Send me e-mail about this -- but NOT to THIS username (this machine is going to be down sometime in the next few days, and is not all that reliable to begin with). Send instead to

Chris_F_Chiesa@cup.portal.com

That's much easier for me to receive and answer.

Chris Chiesa

While reading USENET, I Discovered something written by RCH....

*I have a couple of questions from people who built the interface... like
*what was your total cost (shortwave receiver, modem, parts, etc),
*what problems did you encounter receiving the fax signals, etc?
*Are there many things sent fax now? The article mentions AP photos
*and the like being sent on certain frequencies at various times....
*Thanks for email or net replies!
* __ Ric Helton RCH@cup.portal.com
* \/ PO Box 2133, Athens, GA 30612-0133

RCH,
If you can call Long-Distance, contact Mike Delaney on the Bay Area Atari Users Group BBS (408) 986-0215. He has built the interface (nice pictures too!).

I have tried building it, but failed (lack of a PC-board probably caused problems.). Mike has a pc-board, and I'm sure he'd be willing to send you one.

I've recently moved to a new apartment, and I want to put my Atari computer equipment on Renter's Insurance. I need information about "replacement costs" of the various items, though, and I have NO IDEA since I bought most of this stuff quite a while ago. Below is a list of what I have; I'd really appreciate it if anyone in a position to know, would send me current "replacement cost" information on these items. What I'm after is, how much would it cost me, TODAY, to go out and BUY these items (or their equivalents). Thanks in advance.

Atari 800XL computer (* All items "with power supply" *)
Atari 1050 disk drive (normal)
Atari 1050 disk drive (with U.S. Doubler chip)
Atari 1020 printer/plotter
Atari SX212 modem
Atari 850 Interface Module
SIO cables
Printer cable (from 850 to Centronics parallel)
Modem cable (full-RS232 from 850 to standard DB-25)

I'm deliberately NOT listing disks, software, etc., as I don't have ANY good idea what I have, nor the time to go through and "figure it out."

If anyone reading this message can think of any item(s) I may have left out, e.g. supplies (paper, ribbons, disks), that should be listed, please feel free to point them out to me.

I bought Kyan Pascal over a year ago, and haven't used it much because up until recently I only had ONE DRIVE -- Kyan Pascal requires that you have certain utility and library files in D1: at all times, which didn't leave much disk space for me to work on PROGRAMS! I haven't had a chance to try it with TWO drives, yet, because I've just moved. Unfortunately, Kyan is either out of business or just doesn't make their Pascal anymore, but maybe you could get it from someone who's not using it any more.

A public-domain C compiler -- called "CC8," as I recall; can anyone confirm or reject? -- was posted right here sometime last year. It works with a particular commercial compiler's public-domain Run-Time engine (whatever that means; I haven't tried it myself yet although I did pick it up), Ace C I believe.

Sorry I can't be any more specific, but perhaps this will jog the memories of others on the Net who may remember more than I.

Send me E-mail if you totally bomb out; I might be able to compress the CC8 disk (if I can find it -- moving etc.!) and send it to you UUencoded.

Source record: 115663

Hello all. Just curious to see what other people's feelings are about Antic's decision to go to a disk-only format. (For those who haven't heard, beginning in August, you can *ONLY* subscribe to the disk version of Antic magazine. Current subscribers automatically have been given a 2 for 1 deal - for every 2 issues left on your subscription, they're gonna send you 1 disk version)

My opinion? I don't like it. *Occasionally* Antic has a month where I'd *want* the disk version (such as last months AMP 2.0 music program, along with song files). But usually it's the same old "1 BASIC game, 1 tired utility (like yet another font editor), 1 tutorial and 1 little tidbit" format. Many months I wouldn't want the disk if they through it in for free. I'd be all for going for the disk subscription *if* they now will shift towards longer, better programs (and more ML instead of BASIC stuff) since they don't have to worry about the length that people have to type in. But if they keep to the same as they've been, I'm afraid they've lost a loyal 8-bitter and 5 year subscriber.

Please do not publish the following information anywhere outside USENET
(i.e. newsletters or pay systems. I guess BBS's are ok, though.)
I had a chat with Chuck Steinman on the DataQue support BBS, and he was
very helpful in answering my questions. It seems that the 65816 processor
used in the Turbo 816 is rated for 5 Mhz, though it appears it would probably
handle 8 Mhz. However, due to restrictions placed by the RAM on the
motherboard and some of the support chips (Pokey was mentioned), the Turbo
will be running at the normal 1.79 Mhz. { This may sound very limiting, but the
65816 in native mode will still be a good bit faster due to its ability to
handle 16 bit data chunks. More advanced features of the 65816 help as well
(there are two commands to move blocks of memory.) } DataQue is working on
this problem and will probably release an accelerator board in the future to
increase the speed closer to the chip's limit.
(Info in {} above is my own, not Chuck's.)

If you are interested in calling this BBS, the number is (419)529-5197
(I believe it is ASCII, 300-1200 baud).

2263. Need information on double-density SIO commands

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-04 01:41:53 UTC
From: charles@c3pe.UUCP
Message-ID: <7097@c3pe.UUCP>
Source record: 115667

Now that I have an Atari drive that can read and write 256-byte sectors, I'd like to try accessing floppies from a CP/M machine in our office, which can write 40-track, single-sided, double density 256-byte sectors. However, I haven't been able to successfully use SIO to read the sectors.

I have a BASIC program with machine language assist which can read/write the standard 128-byte sectors via SIO calls, stuffing 'R' into DCOMND and filling in the other fields of the DCB for sector number and buffer. I hoped that by putting 256 into DBYTLO/HI I would be able to read the sectors, but I only got data for the first three sectors, which leads me to believe I'm still only giving the "single-density" read command, and the drive is being tolerant in case I'm trying to boot from PROM.

So, can anyone shed some light on this issue? Thanks for any information...

You should be able to do that (I once wrote an ATR8000 "driver" that allowed
it to read/write 128-byte 1050-double-density disks, and another than read
1024-byte CP/M disks). The major gotchas are (1) use $E459, not $E453 (the disk
handler), since $E453 code resets the length to 128 bytes before doing anything,
and (2) make sure you set the drive to double-density mode (if you need to) --
this depends on the type and generation of the drive . . . they're all different

Could you post some more information about the DataQue Turbo-816,
as this is the first I've heard of it.

From what you say, can I assume that it is a board that runs
standard Atari/6502 software, but using the 65816 instead of a 6502 ??

I am interested because the final year project of my degree was
to add a 65816 2nd processor to an Atari 800XL. I ran the 65816 at 2.5MHz,
as I was not constrained by the graphics chips (Antic,GTIA) which require
the Atari to run at 1.79MHz. This meant that graphics progs would not work
unmodified, but stuff like BASIC, and Assemblers would.
The software ran twice as fast on the 65816 as on the 800XL (because the
6502 on the 800XL is slowed down by DMA performed by Antic).

I connected the two together using the 800XL's parallel port. Any
I/O operations (such as screen, keyboard and disc accesses) were passed
across the parallel port to be handled by the 800XL. Thus the 65816
took over the role as main processor, and the 800XL was an intelligent
terminal to it.

It sounds like you have the XF551. I have hacked around doing exactly what
you are doing. I believe that the way the density is selected is by using
'R' with the number of bytes; 128 selects single density (which is what the
first three sectors are written in) and 256 selects double density. That's
all. Note: the standard SIO entry (the address escapes me) resets the byte
count to 128! If you have the OS listing, you should be able to figure out
the proper address; that is, the routine that is called after SIO sets byte
count to 128. I can look it up if you need it.

My mission was to transfer files from IBM PC to Atari. A kind soul on the
net came to my aid with a program to r/w Mydos 256-sector files with a
PC, and as it turns out Spartados can r/w Mydos disks. I was prepared
to write all that stuff myself! It all works beautiful now.

=>standard Atari/6502 software, but using the 65816 instead of a 6502 ??
=>
Correct. DataQue has also completely rewritten the Atari OS in the 65816 native mode. The basic upgrade will replace the OS ROM, 6502, add one wire to the motherboard, and will initially run about $120. Supposedly they have gone to great pains to maintain compatability with existing hardware and software., and I understand they have had reasonable success. They will be adding all sorts of neat stuff like a card bus, enhanced color graphics card, RAM cards, accelerators, coprocessors, and some other stuff.

=> I am interested because the final year project of my degree was
=>to add a 65816 2nd processor to an Atari 800XL. I ran the 65816 at 2.5MHz,

2271. CROSS-COMPILING WITH AN IBM-PC:HOW TO DO IT?

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-06 01:38:44 UTC
From: rvp@cbnewsh.ATT.COM
Message-ID: <1179@cbnewsh.ATT.COM>
Source record: 115675

I am a longstanding atari 8 bit enthusiast, with an interest in
writing game software. I have done so with various assemblers,
BASIC, and ACTION!

I have recently stepped into the IBM-PC world, and I am pretty
satisfied with most capabilities available, except for support for
game programming.

Rather than throw money into 8-bit hardware and software, and time into
learning their details, I believe that my most productive option for
developing 8-bit games would involve cross-compiling code on the IBM-PC,
and downloading it via the PC's serial port to my Atari 800, somehow.

It seems reasonable that one could download binary code serially to the
ATARI 800 at 9600bps using some dedicated driver for this purpose,
through the 850 interface, joystick ports, or SIO interface (whichever
is cheapest, easiest, and fastest, of course).
Therefore, An 8K program should take only 10 seconds or so to download.
At the same time, I could avail myself of the IBM-PC's speed,
cheap hardware support, to support program development.

Does anyone out there work in this type of environment?
If so, I am sure the net would be interested in the particular
software and hardware you use, on both machines, to accomplish
this type of seemingly ideal work environment. I certainly am
interested! Please share your knowledge.

If you know of source code for a 6502 cross-compiler written in
portable C, please let me know.

I could compile the cross-compiler code on my IBM with MSC 5.0.

Thanks!
Rob Phillips (homxc!rvp)

> It seems reasonable that one could download binary code serially to the
> ATARI 800 at 9600bps using some dedicated driver for this purpose,

Assuming I had the appropriate cross-assembler that wrote its output into the appropriate Atari-required format ($FF,$FF headers, etc.) on the PC, I would proceed to download it from PC to Atari using MS-Kermit on the PC, Kermit65 on the Atari, and a null-modem cable. I've used this technique to transfer Atari executables from my Amiga to the Atari, after downloading them from BBSs onto the Amiga, and it works fine. I wouldn't try just DUMPing the binary data from one computer to the other; I'd prefer to use some Kermit or XMODEM error-correction protocol. On the other hand, that's more of an issue when one is using a telephone line, than when using a direct cable...

> Therefore, An 8K program should take only 10 seconds or so to download.

I'd say that's about right. I was able to use 9600 baud over the null-modem cable, through the 850 interface.

> Does anyone out there work in this type of environment?

I haven't tried cross-assembling for the 6502 since I became a CS major; I did try it once on an IBM mainframe around 1982 though. Ack.

Have you considered writing your OWN Atari-specific 6502 cross-assembler in, say PC BASIC or whatever language you're familiar with? There's a COMPUTE! book in existence that contains 6502 assemblers and disassemblers, written in BASIC, for the Commodore 64 and the Atari 800; perhaps you could use those as a jumping-off point and "port" the concept or the information from that program over to the PC? I'd do it that way myself if I were going to try it; first off, I'd need the existing program as a crutch to know what I was doing, and second, I'd then have full control over the format of output, addition of features I needed (like, reading the source from a text file that had been previously created under one's favorite text editor), etc.

> If you know of source code for a 6502 cross-compiler written in
> portable C, please let me know.

Hmmm... I think there's something for the Amiga that will cross-assemble 6502 code -- with switches for "machine-specificity" for the Atari 800 among other popular machines... THAT might be written in C, although I don't know

how "portable" it would be...

2273. 6502 cross-operations on other computers

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-08 01:19:57 UTC
From: cfchiesa@bsu-cs.bsu.edu
Message-ID: <7636@bsu-cs.bsu.edu>
Source record: 115677

Whoops. I recently responded to someone's "I wanna cross-assemble (or compile) for my Atari on a PC" posting, with a comment to the effect thathere was "something for the Amiga" that did 6502 cross-assembly, etc. etc...

I looked through my Amiga disks and found the program I'd THOUGHT was a 6502 cross-assembler -- and it turns out it is a 6502 DISassembler, NOT an ASsembler...

Sorry for the unwarranted excitement; there may STILL be something out there, but it's not the one I thought it was.

I noticed a few articles concerning a 6502 cross-assembler.
One DOES exist, in C - although I don't know how portable
it is. It's written primarily for APPLE II users, so it
probably needs to be tweaked a little, but someone has done
the major work already.

On the InterNet, it's available by anonymous FTP from
kentucky (128.163.128.6 is the address) - login as anonymous,
with the password 'guest'. Get the file
/pub/appleII/misc.utils/unix6502asm.tar.Z
onto your local Unix system, uncompress it, and un-tar it.
Docs are included.

If you don't have access to a Unix system or can't uncompress
or un-tar, I could try to post it - but it's a few files.
Let me know either way.

Hope this helps,

Mac/65 is an excellent assembler, and I highly suggest you purchase it over the Atari Assember/Editor cart. Although, I must say that Mac/65 has no resident debugger, and for that alone, the Atari Assember/Editor cartridge is nice to have lying around. Mac/65 FLIES when compiling as compared to the Assember cart... And it has a lot more features...

Good luck!

RE: Mac/65 Is it worth buying?

Yes, yes, a thousand times yes! I used the atari editor/assembler to create
a disk copying program...it took 3 minutes to compile about 100 lines of code.
Using Mac/65 it took about 10 seconds and that included writing to disk
(though I do use a ramdisk :).
The debugging portion of MAC/65 (called DDT appropriately enough) is
unbeatable, it makes debugging a delight rather that the awful chore it was
with the Atari cart.
So, I give MAC/65 a 10 across the board...it is the best assembler/editor
ever made for the Atari 8 bit. And on top of all that...it is being sold by
ICD, Inc...the number 1 atari 8-bit company.

I am looking for information regarding the conversion of video signals from one format to another. This is because the XEP-80 only has a composite luminance output, and since I don't have that type of monitor, and further, few computers use them anymore, I'd rather convert the signal so that I don't have to go buy an obsolete monitor.

For starters, I'd like to see the output of the XEP-80 on a regular TV (via the rf modulator), so what kind of circuit would do the trick? After I get sick of looking at the poor results, I'll want to switch to a monitor that works with IBM PC's (i.e. a cheap TTL monochrome monitor), so if you have any ideas or references on how to do this, let me know.

All so true, except for the "no resident debugger". The current version (with
the yellow manual) does include the DDT debugger in the cartridge.

> Good luck!

On the other hand, if Omnimon is sufficient debugger, and if you have a
text editor that handles unnumberd lines, I will be posting a PD assembler
in the next few days (source is available, let me know if it should be
included with the binary, seperately, or not at all...)

Source record: 115690

A little background:
I am using SpartaDos X version 4.2 with an MIO (256k), 130xe, and 20 meg
hard drive. Whenever I run Textpro3.2r under this it:
1) locks up if I let it sit for a few minutes
2) doesn't allow /C /Z /A to work

Does anyone have a fix for these problems?

Ok, assuming that no one does, could someone please drop a line to:

Ronnie Riche on Compuserve (70337,3727)
or Mike Collins on Compuserve (74005,475)
and ask them for a fix to the problem.

Ok, now for a silly unlikely wish...does anyone have the source code for
Textpro 3.2R? OR is Ronnie Riche or Mike Collins on the net somewhere?

Thanks
Charles Hughes

Atari published, around 1982 or so, an OS Listing and a DOS listing, both in 6502 assembly source. The DOS listing is actually a DUP.SYS listing, though - not the FMS routines that actually manage the disk, but the "DOS 2.0" menu-screen application program that lets you REQUEST various disk/file operations...

I believe the FMS itself (the REAL "DOS" listing) appears in "Inside Atari DOS," a long-since-discontinued COMPUTE! Books publication. I've been trying for years to track down and obtain a copy, but they're very scarce. COMPUTE! doesn't print it, doesn't have any copies (that they know of or will admit to) lying around unsold, and doesn't have any suggestions on obtaining it; the only option here seems to be to find someone (through this Net or other means) who HAS a copy and would be willing to sell/loan it to you.

I know there are a couple of people reading this right now who have it and are willing to sell/give it; I've talked to a few of them, and come "this close" a couple of times, but so far none of the deals have been completed although the current one is JUST ABOUT to! (Hi Tom... mail it yet??? :-)) Give it a try.

I am not sure why it locks up. Can you include how the CONFIG.SYS is
setup and are and drivers running, like KEY or TD?

I would try to start with a simple config, ie. USE SPARTA BANKED, with a
ramdisk. Copy TextPro to the ramdisk then if possible unpower the MIO,
then run TextPro for a while. If this works add more components until
you have the configuration in which it fails.

> 2) doesn't allow /C /Z /A to work

The reason these don't work, is that SDX changed the way NOTE and POINT
operations work which TextPro uses for these functions. Before it would
give an offset relative to the disk, now it gives the offset relative to
a file. You could possibly try to find the locations in TextPro where
the offsets are calculated, via an XIO call, then change the values
passed, but this might be a bit much.

Another possibility (especially since you have a hard disk) would be to
boot SpartaDOS 3.2d, run TextPro, then re-enter SDX by either going to
BASIC and peeking at an address (5???? I forget it) which re-enables SDX
after you press RESET.

From: charles@c3pe.UUCP
Message-ID: <7199@c3pe.UUCP>
Source record: 115695
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm

The convergence on my Commodore 1702 monitor is pretty good, but I feel that the ability to disable the red and blue would improve the legibility of text in my 80-column terminal emulator. I'm sure that nothing more than a couple of switches at strategic points in the circuitry is necessary. Has anyone already done this little modification? I'd appreciate knowing the best place to do this.

Thanks, Charles Green

I know the reason the /C /Z /A commands don't work, it is because SDX thinks
that the / is part of the filename. That is what ICD said in any case.
Textpro doesn't terminate the filename line properly, so when I do a load
"D1:>JUNK.TXT/C" SpartaDos X receives the filename exactly as shown, complete
with the /C. I just want a fix for this problem. (A short ML routine to put a
EOL at the / before turning control over to SDX would do the trick, but I
don't want to disassemble Textpro to make the patch.)

As for the lockup...this only happens with Textpro and SDX. Since I keep my
entire system connected when using SP3.2 none of the peripherals should be

causing it. The config.sys is:
```
USE BANKED
SET PROMPT=SDX D$N:
SET PATH=CAR:;1:>U*>;1:>;2:>MOS*>
SET CAR=C:BXE
DEVICE SPARTA
DEVICE SIO
DEVICE ATARIDOS
DEVICE CLOCK
DEVICE XEP80.SYS
```

I keep KEY ON, and TD ON while using it. I can live without TD ON but if I have to do a KEY OFF I'd rather trash SDX and use Sparta 3.2.

FYI - Bobterm is a new terminal program by Bob Puff (SuperArc/Unarc) but KEY ON has no effect, you still type at normal atari speed and that really sucks. Apart from that it is a really nice program, now if he will just let the KEY ON work. :)

How so? I just received my OSS (now a division of ICD) Mac/65 cartridge,
and it contains DDT ("Dunion's Debugging Tool" :-) on-board. At least, the
manual says it's there... Claims to have a debugging screen that's separate
from your program's display, which sounds like a nice feature. What am I
missing here?

Yep, here I am.

I am about to release a new copy of MYDOS -- some real minor bug fixes, and changing the format back to the old Atari AMAC text format -- it should be easier on anyone trying to do cross development, and it then can be assembled with the A65 assembler I will also be posting. If anyone has a PD text edit/program editor and a C compiler, we would have a full blown system!!

2298. 65816 motherboard replacement...

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-18 20:36:17 UTC
From: jca@pnet01.cts.com
Message-ID: <4411@crash.cts.com>
Source record: 115702

I heard that there was a 65816 motherboard upgrade kit/replacement for one of the Atari 8-bit machines (XL/XE I believe) could somebody give me some in depth information on it?

```

2299. INNOVATIVE CONCEPTS PRESS RELEASE

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-19 14:01:30 UTC
From: kimes@ihlpe.ATT.COM
Message-ID: <4845@ihlpe.ATT.COM>
Source record: 115703

Note: Posting of the following press release is for information only and
does not constitute an endorsement by me or my employer AT&T.

(From CompuServe and Zmag #161)

Innovative Concepts (I.C.)
31172 Shawn Drive
Warren, MI 48093 USA
Phone: (313) 293-0730
CompuServe: 76004,1764

New Products!

We at I.C. are proud to announce the availability of 2 NEW products. They
both are available NOW. If you have any questions reguarding these, or any
of our other fine products, please contact us.

Ramdrive + XL to XE
==========

Finally, a low cost memory upgrade for the Atari 800XL computer! This upgrade
brings the total RAM to 128K, AND gives you 100 percent compatibility with the
130XE, including the Extended Antic Modes! This allows you to run programs
like: AtariWriter+, Basic XE, Typesetter, Synfile+, and many others.
Or you can use the extra 64K of memory to set-up a RAMdisk (a FAST simulated
disk drive) which is EXCELLENT for disk maintenance. Coming soon: A 128K
upgrade for the 600XL (yes!).

Installation is required by an experienced kit builder (requires some
soldering).

Price: $59.95 (+ S&H - see below)

Happy Doubler
==========

Now, Happy 1050 Drive owners (and clones) can program their drive to be
fully compatible with ICD's U.S. Doubler! This includes formatting
disks in the U.S. Sector Skew--making reads and writes MUCH faster! Also,
the software allows you to re-program the drive numbers to be D1: thru D8:
without having to use the drive's dip-switches. This allows you to to
have up to 8 drives online!

Best of all, since the Happy Doubler is completely disk based--no installation
is required! And, unlike hardware mods, you only have to buy the software
ONCE, no matter how many Happy 1050s you have!

Price: $19.95 (+ S&H - see below)

U.S.: Be sure to include $3.50 Shipping and Handling with your order.
COD is available (U.S. only) at $3.00 extra.

APO/FPO: Include $3.50 with order.

Canada/Mexico: Include $7.00 with order.

ALL other countries: Include $10.00 with order.

2300. Vintage Atari 800 still for sale !

WOW! I thought I was seeing things when I first read this message. $175 for the Atari 800 used, when I can get the same thing from a dealer for $40?? I think you should look at the market prices before you come up with your selling price next time. But, hey, if you can get someone to pay that- more power to you.

I might be interested in this. Do you have an author, publisher
and ISBN number?

Does the book contain a reasonable description of the workings of
DOS 2, or is it just a source listing. Is DUP.SYS also covered (i.e. the
DOS menu), or just DOS.SYS ?

From: slackey@bbn.com
Message-ID: <41785@bbn.COM>
Source record: 115759

Hello again, with requests as usual.

1) I am in need of the cheapest used disk drive that works that I can get my hands on. The dirtiest slimiest 810 will do. Anyone interested in selling that old relic? I don't even need a power supply.

2) Does ANYONE know how to convert a 65XE into a 130XE? I have seen upgrades for the 130XE to like 576K is it? but never a mention of the 65XE. OK I blew it, I should have sprung for the extra $30 and bought the 130XE. I admit it. I am an EE so even the most general instructions will do.

Thanks! -Stan

I was editing a really long letter to a friend, when I saved it, proofread it, and tried to reload it after rebooting, it Severely truncated the file. Arrg. When trying to copy the file to another disk it stops partway, and says either file name mismatch, or file number mismatch. I would REALLY appreciate it if someone could send me a sector editor that could take an ENHANCED density disk, and somehow build a file back up that has a corrupt sector in the middle. I wouldn't even mind loosing the bad sector! I would be willing to go through a disk sector by sector, and build the file from individual sectors. Im operating on a atari 130XE with access to two Indus drives, an Atari 1050, and an Atari XF551 drive. I dont think it matters, but I am also using the ICD P:R:Connection. Please send any program that might do the job by Email.
Thank you so much in advance!

>I was editing a really long letter to a friend, when I saved it, proofread it,
>and tried to reload it after rebooting, it Severely truncated the file.

1) There were routines from like Analog posted here several weeks ago to help someone hack disks on the bare metal. Part BASIC, part assembly, they could be used as building blocks to help recover your files.

2) I had my own versions of these which I had written, so I did not save them. Note the use of past tense.

A) I was using ARC (for the first time) under DOS XE (also for the first time). Something I or ARC did caused the root directory (at least) on the DOS XE disk to get trashed. Has anyone tried ARC under DOS XE? (That is, was it ARC or me that screwed up?)

B) Given that my sector hacker is lost, would someone email or repost the Analog(?) one? I would like to try to reclaim some of the lost files.

I mean, like, don't you just hate it when for the first two years you keep lots of backups, and then for a full year you never need the backups, so you stop bothering to take them, then when you try something new and screw up for the first time in two years is the time you didn't write protect the disk? Like, don't you just hate it when that happens? I know I do.

I was thinking that a cassette might be a great way to make backups. How much data does like a C-90 hold? Does ARC/UNARC do tapes? Or should I just go ahead and write a backup program? If I hadn't gotton a second disk drive I would have done this ages ago anyway.

>Hello again, with requests as usual.
>
>2) Does ANYONE know how to convert a 65XE into a 130XE? I have seen

Years ago, I upgraded my 800XL to 256k by replacing the 64kb chips, which sat in sockets, by 256kb chips and adding a small pcb with 8 TTL IC's. It was all pretty straightforward. The RAM chips where 7.35 DG each, the TTL stuff was a few guilders, alltogether it costed me about 95 DG. That would be roughly $40,- now...

As far as I know, the 65XE is an 800XL in fancy casing, so you might be able to do something with the schematics. I wrote an article in the 'Stackpointer' the newsletter of the Univ. computer club. It's in Dutch, but all that matters is the schematic and the printlayout :-)

Anyone interested in this info, mail your SnailMail address and I will send you a xerox-copy of the article. I will wait till july first to collect addresses of interested people. Then I will send them the info. Requests coming in later than july first I will not reply to.

I will need at least a week to dig up the newsletter in my messy room anyhow :-). Hopeing that I can do some Atarians a favor,

Michel 'Mikki' Waucomont

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <19799@cup.portal.com>
Source record: 115766

Mark Reed asked about the Atari ASM/ED cartridge SAVE command...

The SAVE command looks like this: SAVE#D:FILE.EXT<STARTADDR,ENDADDR

The ADDR arguments are the HEX address for the start and end of the block
of memory you want to save to disk.

The cooresponding LOAD command is: LOAD#D:FILE.EXT

The block will be reloaded into the same address space it was SAVEd to.

Note that this is ONLY for binary blocks of memory...
(finished OBJ code, data blocks, graphics images, etc..)

To save your SOURCE CODE to disk, use this command:

LIST#D:FILE.EXT (optionally with ,xx,yy to save only lines xx to yy)

To reload SOURCE CODE, use: ENTER#D:FILE.EXT

Note that all these commands must be done from the EDIT mode, not DEBUG.

BobR

I think I have an answer to question #2. You can't effectively convert a 65XE to a 130XE. Why? Because it doesn't have the FREDDY chip in it. The FREDDY chip is the 130XE 'expanded' memory MMU. You might, however, be able to get a Rambo XL running in it, but I have never heard of an memory upgrades for a 65XE, of course, I have never (in my 5 years of using an Atari 8-bit) of anybody using a 65XE. What you need to do is to find the exact differences between a 65XE and a 800XL and apply the desired memory upgrade. Believe me, you WERE better off with springing for a 130XE. The 65XE is pretty much vaporware in comparison to the 800XL and 130XE and what you can slap in it.

In article <41785@bbn.COM> slackey@BBN.COM (Stan Lackey) writes:
>2) Does ANYONE know how to convert a 65XE into a 130XE? I have seen

Functionally the 65XE is identical to the 800XL. Thus my first reaction was to recommend any of the memory upgrades for the 800XL. Unfortunately things are not that easy: in the 130XE some of the TTL circuits of the 800XL are replaced by a LSI circuit. This affects the circuitry doing the address multiplexing, which is where all the memory expansions connect. At best this would make it more messy to install any of these upgrades.

The 130XE has an additional custom circuit to do the bank switching. If you can get 130XE schematics, it might be possible to wedge that additional circuit and the extra memories onto the board. (It is probably too much to hope that Atari left space for all that on the circuit board, but I have never seen the inside of a 65XE.

If you can get your hands on an 800XL, you could upgrade it instead, and get a better keyboard in the bargain.

Question: Does the XEGS use the same circuit board as the 65XE?

Source record: 115775

I just posted the UUE version of Textpro3.2R (.com file only) to the net,
now everyone with spartdos X can have my problems. :)

2322. My new Turbo-816

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-24 02:09:27 UTC
From: gdtltr@vax1.acs.udel.EDU
Message-ID: <3879@udccvax1.acs.udel.EDU>
Source record: 115776

Well, it's here and it's in. I was scared off by the dual PROM option. I didn't feel like trying to piggyback my new OS on the old OS. Could get messy. Anyway, it seems to be acting a bit wierd with some of my stuff. Part of this may have to do with my MIO. BOBTERM seems to freeze every once in a while and then mysteriously restart. Kermit65 tends to repeat itself, sending lines of text over again once in a while. This is probably a quirk in the Turbo-OS's R: handler. Speed seems to have increased, since BOBTERM only waited about 1/3 the time I told it to when dialing. Fear not, however, the jiffy clock seems to have been preserved. I will have a more complete report later.

2323. Re: Looking for MyDOS 4.5

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-24 05:36:13 UTC
From: chasm@killer.DALLAS.TX.US
Message-ID: <8446@killer.DALLAS.TX.US>
Source record: 115777

In article <7895@bsu-cs.bsu.edu>, merlin@bsu-cs.bsu.edu (Scott McPheeters) writes:
>
> Can anyone mail me MYDOS 4.5 and the docs??????

I really will be posting a minor enhanced version of the MYDOS source code and documentation in the next week or two -- the biggest difference is that it includes an assembler now, and the code is AMAC-ish so the assembler tolerates it.

2324. An Atari Assembler: A65

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-24 05:38:14 UTC
From: chasm@killer.DALLAS.TX.US
Message-ID: <8447@killer.DALLAS.TX.US>
Source record: 115778

```
# This is a shell archive (Part 1 of 3)
#
# It contains 6 source files that contain the source
# code for the A65 (NON-macro) assembler.
#
# Run it through the Bourne shell "sh" or an unshar program.
# The remaining files when put on a single diskette in the
# default disk drive can then be assembled to generate a new
# copy of the A65 assembler.
#
# The documentation and executable binary files follow.
#
#----cut here-----cut here-----cut here-----cut here----#
#!/bin/sh
# shar: Shell Archiver
# Run the following text with /bin/sh to create:
# a65.asm
# asm1.asm
# asm2.asm
# asm3.asm
# asm4.asm

2325. An Atari Assembler: A65

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-24 05:40:40 UTC
From: chasm@killer.DALLAS.TX.US
Message-ID: <8448@killer.DALLAS.TX.US>
Source record: 115779

```
# This is a shell archive (Part 2 of 3)
#
# It contains the documentation (what little there is)
# for the A65 (NON-macro) assembler.
#
#----cut here-----cut here-----cut here-----cut here----#
#!/bin/sh
# shar: Shell Archiver
# Run the following text with /bin/sh to create:
# a65.doc
# This archive created: Fri Jun 23 20:31:09 1989
sed 's/^X//' << \SHAR_EOF > a65.doc
X
X
X A65 (A very simple 6502 assembler)
X
X by
X Charles Marslett
X Wordmark Systems
X
X
XThe A65 assembler is modeled after the Atari MACRO Assembler (AMAC) that
Xwas distributed by APX along with the MEDIT editor and the DDT debugger.
XThe most significant thing about it is that the source files cannot contain
Xline numbers (so editors that use line numbers must be able to write an
Xunnumbered output file). A second characteristic is that it is a disk-to-
Xdisk assembler (the source must be in a disk (or cassette) file and the
Xobject cannot be inserted directly into memory.
X
XThe assembler is run from the DOS menu using the 'L' command, and prompts
Xyou for the source file name, the object file name and the listing file
Xname: a RETURN in response to the object and listing prompts will cause
Xthe assembler to generate files on the same drive with extensions '.OBJ'
Xand '.LST' using the same file name as the source file. If no '.' appears
Xin the source file name, '.ASM' is its assumed extension. A listing can
Xbe printed directly by specifying 'P:' as the list file or dumped to the
Xscreen by specifying 'E:'. A '-' disables the listing if you do not want
Xone.
X
XA start at implementing support for the 65C02 opcodes is in the code, but
Xwhat is there has not been tested very thouroughly and most of the opcodes
Xand addressing modes are not in place yet. Otherwise, the machine
Xinstructions are as any other standard 6502 assembler would expect.
XExpressions can include +, -, * and / operators as well as HIGH[] and LOW[]
```

```
Xfunctions to extract the high and low bytes of 16-bit numbers. Brackets,
X[ and ], may be used to group terms in an expression if necessary. Symbols
Xmay have up to 11 characters, including upper and lower case letters,
Xunderscores and numbers. Symbols must start with an underscore or letter,
Xand case is significant except for the predefined assembler opcodes and the
Xregister names A, X and Y.
X
XThe machine opcodes recognized are:
X
X ADC, AND, ASL, BCC, BCS, BEQ, BIT, BMI, BNE, BPL, BRA (65C02 only),
X BRK, BVC, BVS, CLC, CLD, CLI, CLV, CMP, CPX, CPY, DEC, DEX, DEY,
X EOR, INC, INX, INY, JMP, JSR, LDA, LDX, LDY, LSR, NOP, ORA, PHA,
X PHP, PLA, PLP, ROL, ROR, RTI, RTS, SBC, SEC, SED, SEI, STA, STX,
X STY, TAX, TAY, TSX, TXA, TXS, TYA
X
XThe assembler directives are:
X
XDB defines a byte, in decimal (12), hex ($0C), octal (@14) or binary
X (%00001100) and may also be a character string (enclosed in quotes)
XDC defines a byte, as above, but with the high bit set (if defining a
X string, only on the last byte of the string)
XDW defines a word, low byte first, as if an indirect pointer
XDS allocates a number of bytes without storing any data in them
X
XORG sets the location counter to a fixed address
X*= same as ORG
XEQU defines a symbol to have a specific value
X= same as EQU
X
X
X
X
X
X
X
X
XINCLUDE causes the file specified to be inserted at this point in the
X assembly (can be nested if the DOS supports sufficient numbers
X of files open at once -- the object, list and source files are
X kept open at all times, and each level of nested includes requires
X one more open file. MYDOS and Atari DOS 2 allow 3 normally, which
X does not allow a listing and include files. If set to 5, the
X assembler could generate a listing and handle 1 level of nested
X includes)
XTITLE specifies the first title line
XSUBTTL allows entering a second title line
XPAGE causes the assembler to go to the top of th next listing page
X
XEND terminates the program and specifies INIT and RUN addresses
X
```

```
XLIST a stub for future expansion
XMACRO another stub (does nothing, not even generate an error)
XMEND another stub
X
XOctal numbers, EQU, *=, and INIT and RUN addresses may have bugs in them --
Xgood luck. Most of the rest has been debugged reasonably well.
X
XThe END statement can have the following forms:
X
X END no RUN or INIT vectors generated at all
X END ADDR ADDR is the RUN entry point
X END ADDR, ADDR is the INIT entry point (no RUN vector)
X END INIT,RUN both vectors specified
X
X(This is what I call minimum documentation, I will add to it as questions
Xare asked)
X
X Charles Marslett
X 8/21/85
X
X
X
XChanges since the first release:
X
XThe assembler now behaves more reasonably when a forward reference is
Xencountered (it used to just generate junque quietly!) -- forward references
Xare forced to 16-bit values if possible, otherwise A65 assumes you know what
Xyou are doing, and assumes it will be an 8-bit value when it is defined.
X
XThe assembler allows upper and lower case symbols, and it is case sensitive.
XIt still ignores case, however, when handling the directives and machine
Xopcodes as well as the register names ("A", "X" and "Y"). Underscores are
Xalso allow in symbols and are treated as letters (makes C people happy!).
XSymbols may also be up to 11 characters long (rather than 8 as before).
X
XThe initial load address is the HIMEM value from DOS (the lowest possible
Xload address) rather than a random value left over in memory.
X
XErrors are marked in the listing file (as before) but they are also echoed
Xto the screen, and the total number of errors (in HEX) are reported at the
Xend of the assembly. If any errors occur, the automatic return to the DOS
Xprompt is delayed until the [RETURN] key is pressed to give you an opportunity
Xto note any (unexpected) errors reported.
X
X
X
X
X
X
X
```

```
X
X
XFinally, some errors that were previously accepted (and generated bad code)
Xare now caught and flagged as errors). These included multiply defined
Xsymbols and some invalid addressing modes.
X
X Charles Marslett
X 6/16/89

2326. An Atari Assembler: A65

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-24 05:42:26 UTC
From: chasm@killer.DALLAS.TX.US
Message-ID: <8449@killer.DALLAS.TX.US>
Source record: 115780
Body handling: Inline uuencoded payload not displayed: a65

```
This is NOT a shell archive (Part 3 of 3).

Rather it is a uuencoded executable binary of the MYDOS A65 assembler.
Remove the lines up to and including the "cut here" line on the front and
remove any lines following the "end" or "size" line, depending on your
uudecoder's preferences, then feed the resulting UUENCODEd file into
UUDECODE (YAU, etc.) to generate a binary executable copy of A65.

----cut here-----cut here-----cut here-----cut here----#

[Inline uuencoded payload not displayed: a65]

size 4732

2327. un-arcing bitnet files

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-24 15:57:00 UTC
From: BIW109@URIMVS.BITNET
Message-ID: <8906251237.AA04907@ucbvax.Berkeley.EDU>
Source record: 115781

A while back I seem to remember something being said about how
compressed files are corrupted when they go from usenet to bitnet. I
think it had something to do with the ascii/ebcdic conversion. I don't
remember the particulars.. I just need to know the story, because
I would like to get mydos4.5 when it comes through... thanks

Ray Courtois bitnet: biw109@urimvs

2328. MYDOS 4.51 source posting

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-24 16:24:21 UTC
From: chasm@killer.DALLAS.TX.US
Message-ID: <8450@killer.DALLAS.TX.US>
Source record: 115782

```
# This is a shell archive (Part 1 of 3)
#
# It contains a note describing the changes made to
# MYDOS from version 4.50 to 4.51, a short file
# describing how to rebuild MYDOS from the source
# files, and the source to the BUILD utility program
# used to install MYDOS into memory -- the final step
# in rebuilding MYDOS from the sources.
#
# Run it through the Bourne shell "sh" or an unshar program.
# Assemble the BUILD.ASM file using the just posted A65
# assembler and read the other two.
#
# The source to MYDOS 4.51 follows in the two remaining parts of
# this posting.
#
#----cut here-----cut here-----cut here-----cut here----#
#!/bin/sh
# shar: Shell Archiver
# Run the following text with /bin/sh to create:
# changes
# read.me
# build.asm
# This archive created: Sat Jun 24 08:36:56 1989
sed 's/^X//' << \SHAR_EOF > changes
XMYDOS 4.51 -- Released June 14, 1989
X
XMYDOS 4.51 restores some of the
X"features" of 4.3, including being
Xwritten in Atari AMAC syntax (that
Xis, compatible with MADMAC and my
Xown A65 assemblers). This seems more
Xconsistent than MAC/65. See the
Xfollowing list for the changed
Xcode. Like 4.50, it mostly fixes
Xbugs in features that never worked
Xright in the past. the changes are
Xvery minor.
X
X
XChanges from 4.50 to 4.51 --
X
X1.Lock/Unlock work the way they
X used to. Query is the default.
```

```
X2.A bug inserted into the program
X load code is corrected (some code
X that has to be resident was moved
X into the DUP overlay area).
X3.The code to work around I/O errors
X deleting the program file in most
X BASIC program "starter"s is re-
X inserted (inadvertently removed
X in 4.50).
X4.Formatting of disks with bad sec-
X tors is reenabled (with warning).
X5.Corrected code to copy DOS.SYS
X from one diskette to another (this
X never really worked before).
X6.The RAMdisk configuration code in-
X serted by Bob Puff was retained,
X but the old code (with specifiable
X I/O port) is restored for non-
X Axlon, non-XE compatible RAMdisks.
X7.The correction to keep the VTOC
X of other disks from being corrupt-
X ed when I/O errors occurred while
X writing a VTOC was worse than the
X problem (any I/O error scrambles
X all VTOCs with output files open).
X Perhaps the best fix is to retry
X forever? Anyway, this is still a
X problem area.
X8.And, of course, the assembler A65
X is included. The executable code
X in MYDOS 4.51 was all assembled
X using A65.
X
XCopying DOS.SYS -- we now . . .
X
X1) load the 3 boot sectors into RAM
X from the source disk.
X2) copy the actual file, renaming it
X "diamond"OS.SYS on the destina-
X tion disk.
X3) write the 3 boot sectors to the
X destination drive (updating the
X sector link mask, link location
X and sector size flag).
X4) rename "diamond"OS.SYS to DOS.SYS
X (updating the sector size flag
X and the starting sector number of
X DOS.SYS).
X
X
```

```
XTo do (before 1990, at least):
X
X1. Add script (batch file) support.
X2. Enable BASIC if no cartridge is
X installed and the [B] command is
X issued. Then, disable BASIC if
X the [L] or [N] commands are
X issued.
X
XAny volunteers?
X
X
XEnjoy,
X

X
X This is the source code to MYDOS version 4.51. It is written in
X Atari AMAC format. Use the included A65 assembler, Atari AMAC or the
X Atari MADMAC programs to assemble it. If you do not want a listing, or
X do not have a printer, and you are assembling with A65, you can specify
X "-" as the listing file and only the object files will ge generated.
X If you want a listing you will probably have to increase the "FILES"
X configuration parameter to 4 (so the included files can be read -- this
X is the cause of the "I" errors).
X
```

```
X Here are a few notes on how to create a working copy of MYDOS
X from the source:
X
X (1) It is easiest to use an older version of MYDOS to assemble the
X new DOS. All filenames used in assembling use the D: default drive
X number; so go to your DOS menu, and set the default drive (and
X directory) to where your source code resides. The source code and
X object files will all fit on one double density disk. If you only
X have single density drive(s), then separate the MDOS and MDUP files,
X but put the object files on the same disk prior to BUILDing.
X
X (2) Load A65 and enter D:MDOS.ASM as the source file. Press return
X for the object file and either - or P: for the listing file. A65 will
X exit back to the MYDOS menu when the assembly is completed.
X
X (3) Load A65 and enter D:MDUP.ASM as the source file. This will
X assemble the rest of the resident code, and also the non-resident
X DUP.SYS part. Again A65 will return to the MYDOS menu.
X
X (4) If necessary, copy the MDOS.OBJ and MDUP.OBJ files to a diskette
X containing BUILD. Now load (and execute) BUILD. This file will read
X the MDOS.OBJ and MDUP.OBJ files you just created. When asked to,
X press START, and you will be in the new DOS! Now use the [H] command
X to write out DOS files, and you're set!
X
X
X What the files contain:
X
X The MDOS.ASM and MDUP.ASM files are "header" files, that have
X some equates, and simply INCLUDE the actual source files (source
X files are MDOS1.ASM, MDOS2.ASM, MDOS3.ASM, MDOS4.ASM, MDUP1.ASM,
X MDUP2.ASM, MDUP3.ASM, MDUP4.ASM, MDUP5.ASM, MDUP6.ASM and MDUP3.ASM).
X Be warned that there are absolute references that MDUP makes to the
X MDOS files; these are limited to locations in MDOS1.ASM so if the
X MDOS.ASM or MDOS1.ASM files are modified in any way, these references
X may need to be changed as well. They are located in the very beginning
X of the MDUP.ASM file.
X
X The DOS.SYS file itself is contained mostly in the MDOSx files;
X but the code that takes care of MEM.SAV and loading DUP.SYS is in the
X file MDUP1.ASM. Because the DOS is split between two files, you must
X take note of the last byte the assembly of MDOS.ASM produced, and
X place this address in the "ORIGIN = xxxx" statement in the MDUP.ASM
X segment, or the possibility of both files running into each other
X will exist.
X
X I think that is about it. If you find/correct any bugs, or do
X any major modifications, Mr. Marslett and I would like to see them.
X Please see the above references on how to contact us.
X

2331. ALFCRUNCH needed

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-25 12:46:00 UTC
From: cfchiesa@bsu-cs.bsu.edu
Message-ID: <7915@bsu-cs.bsu.edu>
Source record: 115785

Hi folks... I'm finally getting around to de-arcing and un-ALFing a bunch of things that've come through the Net over the last eight or ten months, and I find suddenly that I DON'T have ALFCRUNCH! I had an .ARC file that purported to be Alfcrunch, but which FAILED CHECKSUM when I went to de-ARC it. I thought I had it on another disk, also, but... a thorough look-through of all my disks shows NOTHING.

Could someone who has ALFCRUNCH please UUencode it (with or without previously ARCing it) and mail it to me?

Mail me a "I have it" SHORT mail message first, so that I don't clog up this machine's mail system with fifty copies of ALFCRUNCH.

Thanks in advance, y'all.

Chris Chiesa

2332. MYDOS RS-232 handlers (source)

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-25 17:50:35 UTC
From: chasm@killer.DALLAS.TX.US
Message-ID: <8463@killer.DALLAS.TX.US>
Source record: 115786

```
# This is a shell archive (Part 1 of 2)
#
# It contains the source code for the 5 MYDOS RS-232 handlers
# included in part 2. Full source files are included for
# the Atari 850/P:R:Connection version, the ATR8000 version
# for normal configurations, and the ATR8500 version.
#
# Two "diff" files are included showing the changes required
# (to the best of my knowldege) to run the RS-232 port of the
# ATR8000 when the SWP hard disk controller and software are
# installed.
#
# I owe Richard Bennett (author of TOP-DOS) a debt of gratitude
# for his sugguestion that the RS-232 handlers be made "reset-proof"
# and unaffected by loading DUP.SYS. He wrote the original version
# of the Atari 850/P:R:Connection handler.
#
# Richard Morris is also due gratitude for his efforts devoted to
# permitting use of the RS-232 port on the ATR8500. Since his work
# in 1986, I have added Richard Bennett's ideas to the ATR8000 and
# ATR8500 handlers, so this handler may not remain functional -- I
# would appreciate any feedback on problems with any of the handlers.
#
# Run this archive through the Bourne shell "sh" or an unshar
# program, the desired driver can then be assembled using the
# A65 assembler recently posted. If the output file is named
# AUTORUN.SYS and written to a diskette with DOS.SYS and DUP.SYS
# on it, nothing further is required to have a fully operation
# RS-232 handler installed under MYDOS.
#

XThese RS232 drivers for the ATR8000
Xdiffer in where the Z80 code down-
Xloaded into the ATR8000 goes. The
Xoriginal driver (ATR232.ASM) used
Xthe "User Page" of memory not used
Xby the ATR8000 ROM code ($D000).
X
XUnfortunately, the ATR8000 hard disk
Xinterface code is loaded here also,
Xtwo other alternatives are provided:
XATR232HD.ASM loads its code at $EC00
Xto $EFFF, and ATR232HX.ASM loads its
Xcode at $E000 to $E2FF.
X
XGood luck if you need to use one or
Xthe other of these!
```

2333. MYDOS RS-232 handlers (executable)

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-25 17:53:19 UTC
From: chasm@killer.DALLAS.TX.US
Message-ID: <8464@killer.DALLAS.TX.US>
Source record: 115787

```
# This is a shell archive (Part 2 of 2)
#
# It contains 5 RS-232 handlers or AUTORUN.SYS files.
#
# Run it through the Bourne shell "sh" or an unshar program
# after reading the following paragraphs, the desired driver
# can then be UUDECODEd to create an executable AUTORUN.SYS file.
#
#The five AUTORUN.SYS files in this SHAR archive are the RS-232 drivers for
#three common RS-232 adapters used with Atari 8-bit computers. The
#ATARI850 file will load the RS-232 driver from an Atari 850 interface or
#from ICD's P:R:Connection. The ATR232 file is the standard RS-232 driver
#for an ATR8000's serial port (the ATR232HD and ATR232HX are very similar
#RS-232 drivers for an ATR8000 with the SWP hard disk interface installed),
#and the ATR8500 file is an RS232 handler for the SWP ATR8500, second
#generation interface.
#
#The RS232 drivers for the ATR8000 differ in where the Z80 code down-
#loaded into the ATR8000 goes. The original driver (ATR232) used the "User
#Page" of memory not used by the ATR8000 ROM code ($D000).
#
#Unfortunately, the ATR8000 hard disk interface code is loaded here also,
#two other alternatives are provided: ATR232HD loads its code at $EC00 to $EFFF,
#and ATR232HX loads its code at $E000 to $E2FF.
#
#Each file, when uudecoded, will have the same name (AUTORUN.SYS) even though
#the uuencoded files have distinguishing names. So don't decode them all in
#the same directory!
#
#These drivers can be combined with the RAMdisk initialization AUTORUN.SYS
#files by formatting a disk (with the I command), copying MYDOS to it (with
#the H command), copying the desired RS-232 driver to the disk naming it
#AUTORUN.SYS, and then appending the normal RAMdisk AUTORUN.SYS file to it.
#The two copy operations are specified with lines similar to these:
#
# D2:ATARI850.AUT,D1:AUTORUN.SYS
#
# D2:AUTORUN.SYS,D1:AUTORUN.SYS/A
#
#which would combine the 850 handler with the standard RAMdisk startup code.
#

The assembler I just posted uses the disk IOCBs like they were going out of style if you use the INCLUDE directive (and I do in MYDOS). To write a listing to a disk file, you have to have 4 file buffers allocated in the DOS you are running A65 under.

Good luck, and enjoy,

==========

I happen to know that Bob Puff (author of BobTerm) has a Turbo 8-16
board for development, and any problems he has with the two will be
fixed.

How do I know? Because he lives 1/2 mile away from me! If you have
any questions for him, or about his goodies, leave a message to me
and I'll relay the problem/question to him.

2339. ATR8000 info wanted

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-26 20:15:31 UTC
From: bvk@hhb.UUCP
Message-ID: <245@hhb.UUCP>
Source record: 115793

A few questions... Does anyone have information on the ATR8000 internals? I have an ATR, with the 8088 option, but it isn't very useful right now, because I don't know anything about the ROM routines and memory/io map. I'd like to be able to hook it up to my Amiga and use it as a disk controller (to read and write DOS disks), among other things. I'd also like to know if it's possible to run the Z80 and 8088 at the same time. (Or does this happen already, with the Z80 just being the serial controller?)

Also, what is an ATR 8500? I just saw it mentioned in the new MyDOS posts, and I'd never heard of it before.

Thanks,
Brett

Re: Chris and 816 and BOBTERM

Chris...my system says yours doesn't exist so I am posting this on the net
in the hopes that you will see it.

BOBTERM problems -
1) needs a way to clear the buffer without closing the file.
2) keyboard handler routines need to be corrected to work CORRECTLY with
the spartados keyboard buffer.

Others as I find them. :)

One last thing, please send me mail, I should be able to reply to your mail.

2341. Turbo-816 Review (preliminary)

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-26 23:35:46 UTC
From: gdtltr@vax1.acs.udel.EDU
Message-ID: <3885@udccvax1.acs.udel.EDU>
Source record: 115795

Turbo 816 Review

I paid $114 for version 1.1. It took a little over a week to get here including a delay for my check to clear the bank. Installation isn't bad. If your ROMs and CPU are soldered in, you need to desolder them and solder in sockets. There is also one wire to solder from the CPU socket to another chip. That is about it. There is a dual PROM (old OS/new OS switch) option which requires piggybacking the two OS chips (quite messy, I avoided it).
I am currently running WITHOUT the T-816 installed. Reason: it doesn't get along well with my ICD MIO. It works to some degree, but the RAMdisk frequently gets corrupted and the R: device has some problems at times. I will be contacting DataQue within the next couple of days to see if anything can be done to remedy this problem. There is mention in the (minimal) documentation of this and other problems and that they would work on them.
From what I could tell when the T-816 was installed, there will be little advantage of having one until T-816 specific software comes out. I couldn't detect much increase in speed in most cases (though BASIC programs ran a bit more quickly). Programs written for the T-816 will be more compact and run faster. The Turbo-OS looks pretty good. There are a few problems such as a slightly different handling of Shift-Control sequences, but overall a very good job. Most software I tried worked perfectly.
The bottom line is: if you want immediate satisfaction, the Turbo 816 may fall short expectations. However, the future for this product looks very bright. If you are looking to the future, buy one now and send a signal to DataQue that you are interested in the future expansion. Otherwise, I would suggest that you save your money.

Ok, you buncha rotten complainers...here comes Textpro in part of its glory.

The following UUE file is big, and turns into a 58k arced file containing
the newest versions of textpro for SpartaDos 3.2 and Atari Dos 2.5
Also included are the feeble documentation that I have. Good luck.

Message-ID: <7949@bsu-cs.bsu.edu>
Source record: 115799

I thought I ought to pop in here before EVERYBODY "jumps on the bandwagon," to mention that yes, INFO-ATARI8 DIGEST *is* the same articles you've already seen (even your own!) in this newsgroup. You see, some of us see this group as "comp.sys.atari.8bit" on Usenet, others see it as individual e-mail messages arriving from a master server, and others as a newsgroup called INFO-ATARI8, I believe (not certain) on Bitnet. Some people don't receive individual articles AT ALL, but instead receive periodic collections of the articles from the INFO-ATARI8 (same as comp.sys.atari.8bit) newsgroup, under the title "INFO-ATARI8 DIGEST". Thus, if you subscribe to the DIGEST, and also read the ongoing newsgroup, you'll see all the SAME articles.

From: jca@pnet01.cts.com
Message-ID: <4493@crash.cts.com>
Source record: 115804

The question you should be asking that I never got answered a few years ago when I was heavy into the Atari 8-bit scene was this...can you put more than 256K in an ATR-8000 equipped with a Co-Power 88? As for the Z80 running concurrently, I doubt it. Probably the ideal thing to do would be to pop out the 8088 in the Co-Power 88 and replace it with an NEC V20 which can emulate CP/M. The ATR 8000 is a great piece of hardware, but it is somewhat stripped down to what it could have been.

> and I'd never heard of it before.

The ATR8500 is a smaller version of the ATR8000 that differed primarily in that it had (if I remember correctly) a DMA controller and an SIO chip on it rather than the acre of TTL that the 8000 used to access the disk and serial ports. As a side effect, it coul handle much higher data rates when multiple channel I/O was going on, and it had much higher RS232 baud rate accuracy and throughput (one interrupt per character, vs. several per bit with the 8000's software UARTs).

The major problem is that SWP came out with it about the time they had lost the ability to provide any software support -- so it was over a year before Robert Morris and I got the RS-232 driver running, and I do not know of any attempt to use it as an SCSI disk controller. The MIO and Supra parallel bus HD interfaced pretty well killed that market anyway (since they are inherently so much faster).

If I may be so ignorant as to ask, what exactly is the difference between versions of a program "for SpartaDOS" vs. "for Atari DOS 2.5" etc.? Isn't DOS DOS, whatever form it takes? I've always thought that if a DOS was properly written to be called by CIO, the CIO calls from an APPLICATION program ought to all be the SAME. The only exception I could think of, would be if one DOS supported MORE commands than the other. Is THAT what the difference is, then? Fill me in, oh ye advanced programmer types! I know the machine pretty well, but am a bit fuzzy on such interactions...

2353. Score's disappearing!

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-28 14:39:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19890628143924.7.JRD@MOA.SCRC.Symbolics.COM>
Source record: 115707

Yes, folks, it's that time again, when JRD comes and clamors at you about the archives. This time the problem is that Score.Stanford.EDU, the host that's got the Atari 8-bit archives, is going to be decommissioned in a couple of months. (Just when I was almost caught up getting everything installed!)

So, I'm looking for someplace else to keep the archives. If anybody has, or knows of a host that we can FTP to/from, whose system administrators will allow us to take up some space, please let me know. I'd also be happy to hear about things on BITNET, as long as it's possible to maintain the list by mail from outside the BITNET (that's the problem with VM.TCS.TULANE.EDU) I'd also like to hear any other suggestions/ideas about what to do with the archives. In short, HELP!!!!

2354. Re: ATR8000 info wanted

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-28 16:58:27 UTC
From: svh@shell.com
Message-ID: <1243@shell.shell.com>
Source record: 115708

In Article 1881, Brett Kuehner writes:

-- A few questions... Does anyone have information on the ATR8000 internals? I

I have the ROM and CP/M BIOS source, if you're interested.

-- have an ATR, with the 8088 option, but it isn't very useful right now, because

Is that a 256K or 1Meg Co-Power? If it's a 1Meg version, and all you want to do is write DOS disks, I'll swap you a 256K version (there are differences in the Co-Power and Co-Power Plus boards).

-- I don't know anything about the ROM routines and memory/io map. I'd like to
-- be able to hook it up to my Amiga and use it as a disk controller (to read

Possible, I guess.

-- and write DOS disks), among other things. I'd also like to know if it's
-- possible to run the Z80 and 8088 at the same time. (Or does this happen

I know of someone who's done this, but as a general rule, the 8088 uses the Z80 to talk to the outside world (like terminal, disks, printer).

-- already, with the Z80 just being the serial controller?)
--
-- Also, what is an ATR 8500? I just saw it mentioned in the new MyDOS posts,

I bought the bare board ($35) for one of these beasties a couple of years ago. I have only recently assembled it, but am still lacking a few key chips (like the WD1770 disk controller) before I get it up and running. The 8500 is a redesigned ATR8000, that uses (instead of bit-banging) Z80 peripherals, including PIO, SIO, DMA (!! that's something I want to play with!). Also has what appears to be a STD bus connection on the end of the board, that will facilitate hardware hacking, or hard disk connections, etc. Clean design, from what I can see.

-- and I'd never heard of it before.

It's a rare beastie. Mine is the only one I've ever seen. Came too late in the ATARI 8 bit world, I figure.

NOTE TO OTHER ATR8000 / ATR8500 owners: I've developed an autoterm-like program that uses the XEP80 as the 80 column device. If interested, call or drop me a note. It really makes CP/M on the ATR worthwhile. And legible.
I'd also like to chat with another 8500 owner about CP/M boot disks (I am lacking).

2355. Re: Need Sector Editor!

Newsgroup: comp.sys.atari.8bit
Date: 1989-06-29 03:16:19 UTC
From: charles@c3pe.UUCP
Message-ID: <7312@c3pe.UUCP>
Source record: 115709

In article <41834@bbn.COM> you write:
>I was thinking that a cassette might be a great way to make backups.

groan... at least, my 1010 is *very* unreliable.

>How much data does like a C-90 hold? Does ARC/UNARC do tapes? Or should
>I just go ahead and write a backup program? If I hadn't gotton a second
>disk drive I would have done this ages ago anyway.

Um, 600 bits per second / 10 bits per byte = 60 bytes per second.
60 bytes/sec * 60 sec/min * 90 min/cas = a whopping 324 Kbytes *unformatted*
storage per C-90. But using the C: device puts a monstrous interrecord gap
on the tape [grab Tech Ref notes, flip, flip, page 74] of 3 seconds versus
[f FLOAT 9 1 2 8 ENTER 6 0 /] a little more than two seconds of meaningful
data. Ouch - that means about 134 K bytes. A single-density floppy gives
you 90K less a few of the 40 tracks, enhanced-density (1050) 130K bytes, and
double density 180 bytes - double these numbers if you flip your floppies.
Now compare the cost of the cassettes and floppies per Megabyte...

Better to use the Vaporware Industries "RS232 cassette", which hooks up to your
existing stereo cassette deck to read and write data eight times as fast
(4800 bps), using the phase-coherent FSK generated by the XR2206 chip, and
demodulated with the XR2211. Since you now have access to twice as many
tracks on the cassette (left and right in each direction), this works out to
a whopping 5 Megabytes of unformatted storage. And with the optional "Pie in
the Sky" (PITS) backup software, using Hamming error-correction code on 8Kbyte
blocks, you only lose 20% to overhead, yielding you four 1Mb tracks on a C-90.

The glossy says it uses the same frequencies as the old 1200bps voice-grade
FSK modems, only multiplied by four because the 300-3300Hz telephone channel
has one-fourth the bandwidth of the typical cassette deck, so it's certainly
within the realm of available technology.

Let's see, where *did* I put that literature...

<okay, so I'm suffering from jet lag.>

Gary,

Thanks for the address but I am reconsidering because of cost. I am
not rich and I think I need a new disk drive. Mine is beginning to break
down (sometimes it just quits and I have to jar it to get it working again!).
Its an old (1983) and WELL used 1050. I can't complain, it lasted longer
than I first thought it would (it gets real heavy use). So I think I will get
a 551 and wait to see what improvements are made in the Turbo-816, or in its
price.

Charles,

Currently I have a Atari 800XL w/ 256K (Rambo), a 1050 disk drive
(almost), a Star NX1000 printer w/ P:R: Connection, and a used Mercury modem
(1200 baud). I am running MYDOS 4.5 and am considering SDX (input wanted on
SDX!!). I have read the reviews and am disappointed that ICD decided to go
to a MS-DOS style after MS-DOS started going towards a UNIX like shell. I am
a UNIX guru so would have been more happy with a UNIX like interface. I don't
know about you but I've worked on CMS, VMS, MS-DOS, UNIX (both system V and
Berkley), and Atari DOSes. And, although its not perfect, UNIX is the best of
all of them.
So what does your system consist of? Do you own SDX? I would like to
know about it from a REAL user and not a review in some magazine.

Paul Amonson
BITNET: AMONSON@IDCSVAX

P.S. Oh, and thanks for any help you (or anyone) can give me.

=>
=>P.S. Oh, and thanks for any help you (or anyone) can give me.

I'm not Charles, but I own an SDX. It isn't bad at all. I am getting
really spoiled having ARC at my fingertips at all times. If you are getting
an XF551, SDX would be a good choice. It supports the increased size & speed
of the 551 with no problem (note: I don't have a 551. This is an ICD claim
which I have not heard disputed). The interface is nicer than SDCS 3.2d &
does resemble MS-DOS. Devices such as E:, R:, D:, P: etc. are not supported in
the command processor. CON:, COM:, DSK:, and PRN: are used instead.
Note: COM: had no default driver & does not recognise the R: driver. Therefore,
there is currently no way to call the R: device from the command processor in
SDX. In the command processor, drive letters may be used instead of numbers.
D1:, D2:, ..., D9: can be written A:, B:, ..., I:. From programs, you can

use DA: instead of D1: & so on. You can also use DCON: instead of E:, DPRN: instead of P:, etc. There is an additional device, CAR:, which is a ROMdisk on the cartridge. This is where the Command Processor, device drivers, and built-in utilities lie (e.g. ARC). Like MS-DOS, SDX has environment variables. PATHs are quite useful. PATH defaults to "CAR:" so that you don't have to type "CAR:ARC". Two other variables, "BASIC" and "CAR" act like MEM.SAV. When you return from BASIC, if the "BASIC" variable is set, your work area is saved to the filename in the variable. "CAR" is similar in function. BASIC and CAR are different commands in SDX. "BASIC" refers to the built-in Atari BASIC while CAR refers to the cartridge piggybacked on top of the SDX cartridge. Therefore, theoretically, you can work with Action!, switch to BASIC, and then go back to Action! without losing anything. I/O redirection is handled differently from 3.2d. Batch files now only executed command processor commands & don't redirect the E: device. To execute a command & redirect the input/output from/to a file, just add <</>> and the filename to the command. For example "DIR >>PRN:" will list a directory to the printer. "BASIC <<PROGDATA.LST" will go to basic and act like an ENTER "D:PROGDATA.LST". Pipes are not supported. SDX has a slightly different (though compatable) directory structure than (to) 3.2d. It allows you to have over 1000 files in a directory. There is also an archive bit for doing backups. A new menu program comes in the ROMdisk for those tasks for which one is appropriate. Unlike the SDCS MENU.COM, it is not supposed to replace the CP. For those who are familiar with it, the SDX MENU is a lot like XTREE on MS-DOS machines. It can be quite handy in moving files around. The only major concern about the SDX is the lack of technical reference. I have been told (though I don't remember where) that ICD is aware of the problem & will try to put something out. It seems most of their technical documention is in ML source code comments. If you have any questions about the SDX, feel free to ask.

Paul Amonson
BITNET: AMONSON@IDCSVAX

P.S. Oh, and thanks for any help you (or anyone) can give me.

Paul - my system consists of: 130xe, 256k MIO, 2 20meg hard drives, indus disk drive, xf551 disk drive, supra 2400 baud modem, panasonic kxp1091i printer, magnavox color monitor, xep80, SDX, Rtime 8, Basic XE, MAc65, and about 10megs of software.

SDX (for me) is a great DOS. It appears to be very MS-DOSy :) but I like the command line interface [and yes, I would prefer UNIX myself] which MYDOS and the other Atari doses don't have. There are a few problems with the SDX but these are related to the software I like to use, and not really the fault of SDX. I haven't used any Atari DOS in well over 2 years, so I can't really compare the two, but if you like UNIX you will love SDX compared to Mydos or any other Atari DOS.

Your 1050 can be repaired [in all likelihood] for a mere $50 +tax+shipping and handling. American technavision, and Best Electronics both sell a tandon drive mechanism that replaces the 1050 drive mech and this replacement seems to fix most problems. Another possibility is to call Atari Customer Service and ask about their repair/replace/exchange policy on 1050 drives. Atari has a very good exchange policy with regard to this type of thing, they will exchange a 1027 printer for the XDM? printer for only $75, so they might exchange the drive also.

Oh, one last thing...I bought a surplus keyboard (it's a wonder the things you can find in silicon valley) and rewired it and then connected it to my 130xe via a 3 foot cable. I now have a detached keyboard that is a world better than any keyboard has ever been for the atari, and I am talking about all the Atari machines. My old keyboard is still connected also and it works fine...anyone for a 4 player game of mule? :)

Hello Fellow Netters,

I have one of ICD's 1 meg M/IO boards for sale! ICD isn't making
these things right now (because of the DRAM shortages) so if you want
one, this may be your only chance!

The M/IO has a serial (modem) port, a parallel printer port,
one meg of memory (can be used as RamDisks, Printer Spoolers, or
any combination of the two), and a Hard Disk interface that'll
handle EIGHT SASI and SCSI controllers at once.

Oh, yes, you can also use the serial port for a serial
printer, and put a spooler on it.

1 Meg Multi/Input-Output board with manual and
Interface to hook to a 130XE (has _two_ cartridge ports)

$310

If interested, call (606) 276-3375 from noon to 10pm EST.

Greg Parsons

P.S. If I am not at home the answering machine is.

Charles,

Sorry I guess I have to post, my mail keeps bouncing back. My drive mechanism is wearing. its not the SIO cable (I've had that problem also), no matter how much tweaking of the cable I do it doesn't work. Only a rap on top of the drive works. It also makes a louder than usual (HaHaHa) sound when moving track to track. I have been considering a 551 for about 6 mo. and this problem only appeared about two mo. ago, so I guess I will get the 551 use the 1050 as a second drive until it breathes its last breath. Thanks anyway.

Nick,

No luck with personal mail to you either, boy BITNET sure is FUN!! I did however receive your mail and I do appreciate it. I will probably get it because I hate having to boot from disk (especially with my unreliable 1050) just to use the VAX at my school. Is it true that SDX has a "CONFIG.SYS" simular to MS-DOS to define devices and such? Also how "transparent" is the cartridge? I do a lot of machine language programming and I find it useful to manipulate CART control ($D500-D5FF). How forgivable is SDX? Also I have seen the SDX for around $55, have you seen lower prices, and where.

Thanks in advance!

Source record: 115717

Hello all...

Have finally dug up a copy of Atari DOS 2.5, and begun using the two Atari 1050 drives I recently bought (separately) to replace my decrepit and annoying single-density-only Percom drive. Am running into certain phenomena which I think I've heard a little about, but am not entirely clear on, and am without documentation for DOS 2.5 (I got it on a disk with Atari Protection Techniques book, NOT with either of my 1050's.)

System consists of two Atari 1050 drives: Drive 1 sports a 'US Doubler' chip, Drive 2 is unmodified as far as I know.

I find that I can't reformat an enhanced-density disk into Single density from certain programs (e.g. Bob Puff's Disk Communicator, which insists on doing Enhanced density after presenting me with a choice between Single and Enhanced), but that I seem to be able to do it okay from DOS 2.5 (the menu). Additionally, I seem to be able to READ Enhanced Density MOST of the time on the US-Doubler drive, but not ALWAYS, and can apparently NOT WRITE it at all. All of this is subject to the strong possibility of insufficient evidence, but I'm in a hurry to just get someone to send me the Real Story...

Basically, I'd love to see some technical stuff about the software support for the US Doubler, e.g. what CIO or SIO command(s) must be sent to get into and out of Single, Double, and Enhanced (if it coexists on this drive) densities, at will, for formatting. (I already understand that READING the disk AUTOMATICALLY configures the drive to READ the proper density.)

Ditto for Atari DOS 2.5, including extensions to DOS 2.0 XIO (CIO) calls and parameters for handling the "additional sectors," Enhanced density, et al.

I realize that this is a lot to ask for, and a bit vague at that, but I'm dying for SOME information; I've got all this hardware and only REALLY know what's what when I ignore it all and use single-density only.

Thanks in advance, Oh Net Gurus!

RE: unreliable 1050

Adding an xf551 is a good idea, especially since the xf551 can be upgraded to an 80 track mech (2880 sectors of 256 bytes each :) for about $100. SDX does have a config.sys file but I don't know the MSDOS config file so I can't say just how "close" they are. As for the cart line...forget it....the SDX does not like being played with. I am not sure how the on/off function is accomplished, but it is apparently compatible with other carts (so you could put BASIC XE on top of EXPRESS, on top of DIAMOND, on top of SDX, on top of the RTIME8 and they would all work).

CORRECTION: ICD still manufactures both the 1 megabyte MIO and the 256K MIO.
They only sell these directly (not through dealers). The demand for these
are at a minimum.

P.S.: ICD may even be offering a ROM upgrade to fix some of the known
"features" <ahem> in the near future.

I see in ZMag that Genie has a program called Macread.arc for viewing MAC pics on an 8-bit Atari. If anyone subscribes to Genie and has this program, I'd appreciate it if they'd E-mail it to me or post it.
If someone would upload it to Compuserve, I have a bunch of MAC pics that I could upload. (They're Readmacs for the IBM - I assume this program would work with them.)
Speaking of ZMag, I'd be willing to upload it to this conference each week if there is any interest in it. Is that permitted?

I've had Sparta X for several months now and consider it a well-spent investment in my 8-bit system. Prior to using SDX I used Sparta 3.2d (which at the time I was using to run a Carina II BBS) so upgrading to SDX was a natural choice for me.

SDX seems to work with more programs than before (especially if BANKED mode is used on a 128K> machine with the X command), but there are a few programs it simply doesn't work with (AtariWriter Plus, for instance, although I have heard of a patch to make it work). I __LOVE__ having ARC at my fingertips, although Bob Puff's ARC/DEARC programs are about twice as fast as SDX's. But one nice thing about SDX is the existence of a PATH variable that specifies where to look for programs you want to run. For example, you can have it look at the CAR: (SDX cartridge) first, then the current working directory, then in your D1:UTIL> directory, etc... This is VERY VERY VERY handy!!

I like just about everything with SDX with a few exceptions. I WISH there was a switch on the cartridge that would let me disable it, rather than having to do a COLD /N everytime I don't want it on. Then again, I don't suppose it would be TOO difficult to build one.. :-) Another problem with SDX is the lack of technical documentation. Bob Puff lives in my area, and he had the darndest time getting enough information about SDX so he could make BobTerm work with it (not to mention the CLI!!!!). Is there anything else I don't like?? Not right offhand!!

Oh yea, there is something.. I also wished ICD has aimed more for a UNIX style shell than (gasp!) MeSsy-DOS.. oh well! Can't have everything! Maybe we'll get Unix for the 8-bit now that the Turbo 8-16 board is out.. ;-)

"Inside Atari Dos" is compiled by Bill Wilkinson. The publisher is Compute!
Books, a division of Small System Services, Inc. The ISBN number is:
0-942386-02-7. It deals with how DOS.SYS works, its most important routines,
and how a disk is set up. Note that there is an error in how a sector in a
file is set up, if I remember correctly, the byte which says how many data
bytes in a sector is 127, not 125 (bytes go from 0-127 for a single density
disk). The book also contains the source code for DOS.SYS and DUP.SYS.

^^^^^^^^
No, this book _DOESN'T_ contain the source to the DUP.SYS. Andrew
was right about the author of work. Bill worked for the company that was
contracted to write the DOS for that Atari, OSS (I don't remember if it was
called that at the time, though), and they still had the rights to the source.

Later this same company came out with other DOS' for the Atari that
did not have some of the limitations Atari, Inc. set for the original DOS.

The DUP.SYS was Atari's own software and therefore not included in
that book. Atari DID release the source to it though, as they did the source
to the OS in the technical reference volumes.

I have these volumes if you would care to talk.

****

The Demise of Info-atari

****

As you may know, articles currently posted to comp.sys.atari.st
and comp.sys.atari.8bit are mailed in digest form to subscribers who do
not have access to regular news, and to sites on BITNET and in Europe.
This distribution is now in jeopardy.

Presently, digests are created by Bill Westfield on
"score.stanford.edu", and mailed out using a distribution list
maintained by me at my site. However, the machine "score" will be
decommissioned at the end of August. We therefore need to find another
site which is willing to accept the job. I can't move the
redistribution to my present site, because I will soon be leaving this
job, and will not have direct access to the internet at my new job.

I will be able to maintain the list from this site until score
goes away in August. But in order to keep operating after that, we
desperately need the following:

(a) a new Unix site (preferably with direct access to the
internet) which can furnish us an account from which
to create and distribute digests, and

(b) volunteers who are willing to help with the digest
creation and mailing list maintenance.

(a) is by far the most urgent need, since we MUST get settled on
another machine by the time score goes away, if we are to continue the
mailing list. For some time after the end of August, I will use
PC-Pursuit to get to my account here and maintain the list, but in the
long term, we really need people with direct access to the net.
But I can only do that if we do get a site.

So, if you can help in any way, either by offering an account on a
host for digest creation, or by volunteering to help out with the list
(assuming we find a host,) PLEASE send me mail at the address
given below. If we do not find a suitable site, info-atari may cease
operations on August 28. Thanks,

-ravi

From: ajy2208%ritcv@cs.rit.edu
Message-ID: <1197@cs.rit.edu>
Source record: 115726

Hello!

I am looking for a good spelling checker program for the 8-bit. I know there are a bunch out there, but I need one that works with SpartaDOS 3.2 & Sparta X. I have AtariWriter Plus's spelling checker, but I would rather have one I can use on any document easily from DOS.

I remember that some time ago Antic or Analog had a spelling checker program that started out with a small data file that would grow as it encountered new words. This would be very nice to have, especially if it was fast, and if the source code was included (this way I could fix it to work with SpartaDOS if I had to).

Thanks for any help,

I suggest you try finding a copy of a different DOS. I think the software
engineers who designed DOS 2.5 were on an acid trip when they designed it.
I myself am partial to SmartDOS because it's fairly powerful and easy to use.
If you want something that's more powerful, hunt around for a version of
MyDOS. I believe the latest version is 4.3(at least that's the latest version
I have). It, along with its utilities, can do just about anything you want
it to do an probably some things you don't want it to do. Good luck in your
search.

> anything you want it to do and probably some things you don't want [...].

Well, I *have* a copy of SmartDOS, and of DOS 2.5, and of a "way back" version
of MyDOS (maybe 1.0 or something). I can use my drives from DOS, and even from
BASIC. But what I want to know is the inner software commands that must be
sent to, and received from, a normal 1050 drive, to implement the distinction
between "single" and "enhanced" densities. And then, I want to know how the
installation of a US Doubler chip affects these same operations, e.g. why is it
that only SmartDOS "knows how to use" the US Doubler? (For example, my copy of
MyDOS, and of SmartDOS, both claim that my UNenhanced 1050 is "configurable for
Double Density," but that my US-Doubler'd one is NOT. Obviously, the software's
interpretation of the meaning of "double density" and "configurability" is
DIFFERENT from the hardware's.)

Incidentally, I've been receiving some of the preliminary information about
how DOS 2.5 tells a normal 1050 what to do -- public thanks, Ron! -- but have
yet to hear one peep about the US Doubler effects... (Thanks in advance, Ron,
if THAT is what your "next transmission" is going to include!)

I just replied to article <5531@stiatl.UUCP>, in which david@stiatl.UUCP (David Montgomery) wrote a number of interesting things. I neglected, however, to comment (and ask another question!) on something else:

> If you want something that's more powerful, hunt around for a version of
> MyDOS. I believe the latest version is 4.3(at least that's the latest version
> I have). It, along with its utilities, can do just about anything you want
> it to do an probably some things you don't want it to do.

First off, David, you may be interested to hear that the sources to MyDOS 4.51 (and the assembler capable of assembling said MyDOS sources) were recently posted to this very newsgroup. If you missed it, you might want to have someone send it to you again.

Second, and this is a general question: I'm concerned about the "BUILD" program that was supplied with the MyDOS sources. I notice that it runs "under your current version of MyDOS," and just REPLACES the existing DOS "in memory" and poof, you're in the new version. My question is, will this work under all prior versions of MyDOS, or am I going to be in trouble if I don't have a "relatively recent" version? I think I have (gulp) something like 1.0 ! I know things can change pretty drastically between major revisions, so I would like to have the answer to this question BEFORE I try to install 4.51. Thanks in advance.

>poof, you're in the new version. My question is, will this work under all prior

I assembled the new version of MYDOS with the Atari assembler (AMAC), and
ran BUILD (without understanding exactly what it was doing, but the
instructions said to) under Atari DOS 2.5, and IT ALL WORKED!!! I never
had MYDOS before. I have used SpartaDOS, DOS2.5, and DOSXE. I will
probably be using MYDOS, as soon as I personalize it a little.

BTW, has anyone out there ever attempted to use the RAM under the OS ROM?
If so, please respond; I have some questions...
-Stan

2378. SDX + Indus GT

Newsgroup: comp.sys.atari.8bit
Date: 1989-07-07 14:51:34 UTC
From: briann@tekigm2.MEN.TEK.COM
Message-ID: <5186@tekigm2.MEN.TEK.COM>
Source record: 115732

I recently bought SDX with the expectations of being able to use high speed I/O with my two Indus GTs. Unfortunately, I'm having problems getting disks reliably formatted in double density and high speed skew ***and*** reliably copying files to them. Is anyone else out there experiencing the same problem? I've had this problem before and sent in my drives to Future Systems to have them aligned. Even after that they never were reliable. I gave up until now since I just bought a ~$70 DOS that I want to be able to use. Any suggestions? Should I just buy two XF551s? ;-) ;-)

2379. Re: Densities and their Interactions

Newsgroup: comp.sys.atari.8bit
Date: 1989-07-07 23:53:41 UTC
From: hans@umd5.umd.edu
Message-ID: <5079@umd5.umd.edu>
Source record: 115733

The following information is based on disassembly of the Indus GT ROMs.
It is, of course, in no way related to the intenals of the US doubler,
but may help to shed some light on the situation.

The Indus accepts two format commands. The '"' command (x'22') always
formats in "enhanced" density. The '!' command (x'21') formats based on
the current density. If the current density is single, it formats in
single density. If the current density is double, it formats in double
density, and if the current density is "enhanced", it formats in
SINGLE density.
The current density is determined at power-up by checking the disk in the
drive (configuration switch if no disk is inserted), and changed by
configuration commands, format commands, or by sensing the format of
the disk when the first read/write operation after a disk change is
performed.

See the summary above, the current DOS (whatever it is) is used to load the
new version of MYDOS into a temporary buffer above the BUILD code in memory,
then (after it is no longer needed) the new MYDOS code is copied down to
memory location $0700 on top of the old DOS -- it is then initialized and
started up. The only problem you should have is if the old DOS has some
permanently active interrupt vectors (an embedded display list, or real time
clock support routine, for example) -- Sparta may, I doubt anyone else does.

Bill Wilkinson is correct but misleading. There are 128 bytes in a single density sector (0-127) but only 125 (0-124) are data bytes. The last 3 bytes are for DOS control.

In byte 125, the left 6 bits are the file number. The right 2 bits and all byte 126 are a point to the next sector in the file. Byte 127 is actual number of data byte being used in that sector.

Source record: 115744

Well, I have a 1200xl atari setting in my closet that I would love
to sell. I bought an ibm clone about 3 years ago and have never
looked back. Ok, what does this system consist of:
1 1200xl with 64k.
1 color monitor/can double to play tv programs with vcr input
(I have done this when my main color tv was busted)
3 1050 drives. One is broken, but could be fixed if buyer knew where to
take it. I was using the system for software development at one point
and these poor drives would never make it out of warranty. One of the
drives is in new condition.
1 1027 LQ printer. slow but good print quality.
1 300baud modem...with software and docs.
1 atari graphics tablet.
2 joysticks.
software includes
action!
basic
dos 2
dos 3
a couple games such as galaxian
one comerical wordprocessor/one I wrote in action!/mines better with 6500lines
of source that goes too.
All standard atari docs on machine drives printer and dos's.
Atari tech reference. atari tech notes on the extra 16k of the machine.
two compute! books on 6502 with assembler. And source I believe.
everything goes for $450.00
Call David Clark at (916) 3724764.
I don't read this group. This is my first reading to see what has happened
to these machines in 3 years. clarkj
You could try mail but if it gets to me I am not so sure I can send you
a response. clarkj

2391. Ethics in programming....

I have a question for all the folks out there on the net. This is a very broad question, but since I couldn't find a specific newsgroup to deal with it I decided to post it here since it deals with the Atari 8-bit.

I want to know the ethical [and legal if there are any copyright lawyers out there] rules [laws, scriptures, traditions] of posting/destributing the source code of a copyrighted program. In particular I am speaking of TEXTPRO3.2R. I have been unsuccessful in my quest to locate the authors, so I have disassembled the object code and I am in the process of commenting it. After I finish I want to distribute it [for free] to anyone who asks. Now, how about some comments on what I want to do? Please, no flames, I won't take a single point you raise seriously if you put it in a flame.

From: AMONSON@IDCSVAX.BITNET
Message-ID: <8907120611.AA16021@ucbvax.Berkeley.EDU>
Source record: 115747

Well, I'm convinced. I am going to purchase the 551 drive and SDX!
I really appreciate the help I received from the magazine (Charles, Gary, and Albert). I think that I found the problem with my 1050. I opened it up and took a magnifying glass to the sockets on the drive. It seems that there is a hair-line crack in at least one solder connection. But since I have decided to get the 551 I will not temp fate and try to repair it, at least not until I have the new drive! So if all goes well in a couple of weeks I will have TWO drives and SDX.
I have some new questions for you all. Does somone out there own Diamond or GOE and have you used X windows (I use X)? If you have, I would appreciate knowing the simularities and differences between the Atari carts and X windows? Do both carts work with SDX? Which cart is better?

Paul Amonson
Bitnet: AMONSON@IDCSVAX

P.S. Thanks for future help. (I never know when I get a chance to respond!)

>a single point you raise seriously if you put it in a flame.

Well, I hope you take the points I raise seriously, for you could get
yourself in big trouble. First, if a program is copyrighted, that means the
author of the work owns the rights to it. He/she can do with it what they wish.

If you disassemble the binaries, comment them and then turn around and
distribute them, you are violating the copyright. There might be a good reason
the source is not in the PD and I could go through and list many reasons, but I
don't wish to waste bandwidth.

The end result - unless you have the authors permission, DON'T distribute
disassembled code and place it in the PD.

The 800 power supply is the same as one for the 1050 drive. I made a PSU for my 1050 drive which I bought in a clearance sale and didn't have one.

It's an A.C. unit which supplies between 10 and 15 volts. I just went to Tandy (Radio Shack, you side) and bought a mains transformer of the right capacity (1.5 amps or thereabouts) and bolted it into a box with a mains cord going in one end and a two wire cable coming out with the correct jack on the end. doesn't really matter which way you wire it, because it's an AC setup.

Might not look too good but it worked OK for me.

>Does anyone know where I can get a power supply for my Atari 800 computer?

All you really need to do is get a transformer that delivers about 9V ac @ 3A, for the Atari 800. The XL supply is +5V at something like 3A, again not hard to find.

If you have the old "brick" that used to power your 800, try to fix it by doing this: get a big vise, and squeeze a little. The object is to break the glue joint. You'll find a 3A fuse inside, which probably blew. Replace it, and use a little glue to reassemble the supply. You'll probably be back on the air with your 800. Note: fuses have been known to wear out, just like anything else. When they get old, they will blow at less current, sort of a fail safe.

Another possibility is to go to a Hamfest (amateur radio flea market, usually occurring annunally in the warm months at some high school gym, or church, or national guard base, or some such site, on a weekend day). No guarentees that you'll find what you need, though.

Hope this helps 73 de WA2ISE

BTW, has anyone ever seen DOS 2.6? It's an enhanced version of DOS 2.0 I suppose I could snail-mail a copy of that and some other pd software to anyone interested, and not be a pirate :-)

Best Electronics will be able to sell you a new power supply. However,
they seem to have two different supplies. My older 800 has an 18.5 W,
9V power supply, part number CO14319/CO14748, $10. They also list
a 50W, 9V power supply, part number CO17945/CO17964, $15. I don't know
which you need for that 800. I guess the older ones use the 18.5
supply. If you still have the broken one, then there is no problem.

From: slackey@bbn.com
Message-ID: <42843@bbn.COM>
Source record: 115560

Me again, with my usual barrage of questions...

I am trying to reclaim files from a damaged DOS XE disk. I am having difficulty understanding the formats, though.

According to the manual, a directory entry contains up to 12 pointers to file map sectors. File map sectors contain up to 125 pointers to data sectors. Data sectors contain up to 250 bytes each. So, by my calculations, the maximum size of one file is 12x125x250 bytes, or 375K bytes. However, the manual claims that the max size of a file is 8M bytes. What's the deal?

Some time back I downloaded a patch from a BBS in the Seattle area (THE REEF, number not handy) which patched Turbo BASIC XL to allow the time functions to work at 60 Hz. I don't have the patch (or anything else atari related) with me, but if there is interest I can find, upload, and post the patch program. It's short and in BASIC. As for setting the clock I don't have any ideas off hand. It seems like you're on the right track, though. Try assigning various values to TIME and printing TIME$ (as well as assigning various strings to TIME$ itself). But it sounds like you've tried this already. Sorry I can't be of more help there.

All

I h# ,CC
ave been interested in upgradeing my 8-bit. I enjoy designing circuits that interface with my 8-bit. The T816 seems like one of the best ways to go for an upgrade. But have been thinking of placing my 800 XL motherboard in a Baby AT case along with my 1050 and xf551 drives. Also my P:R: connect should also fix.

If I had an arrangement like this I could reduce the number of power supplies needed to run my system. I also believe that this would leave room for a 1/2 height Hard drive and possible an MIO inside the case!

I also have been dreaming of a detachable keyboard for my 8-bit for quite some time. So far the keyboard has been the limiting factor in doing this upgrade due to the wierd keyboard connector that the 800XL has.
The connector is a 36 connection plastic strip that plug in to a connector that looks like a half width edge card connector!

Has anyone read, attemped or heard about an upgrade similiar I would like to know about it. Any info would be appreciated.

2413. APAC Images.

Newsgroup: comp.sys.atari.8bit
Date: 1989-07-19 16:59:10 UTC
From: larryw@dasys1.UUCP
Message-ID: <10299@dasys1.UUCP>
Source record: 115567

....Excerpted From the APACVIEW.DOC file (Documentation for the APACVIEW.OBJ program by Jeff Potter)
++++++++++++
APAC mode (Any Point, Any Color) was first described (to my knowledge) by Thomas Tanida in ANALOG Computing, Issue 60, May 1988 (pp. 64-71). It is an 80H x 96V display mode which simulates 256 different colors. It performs this feat by displaying pixels in graphics 11 (16 colors) followed by pixels in graphics 9 (16 intensities) directly below them. This also has the negative effect of seeming to produce black lines in between colored lines. From a reasonable distance, the illusion of full color is complete. Although it produces 256 colors, only the hue and intensity can be controlled. The saturation of the color is constant. For this reason, the best pictures can be viewed from GIF files with fairly saturated colors.
++++++++++++

I had never heard of this mode before and then all of a sudden I start seeing a bunch of programs by Jeff Potter using APAC mode. The guy writes good stuff and he will definately get my dollars. (The programs are shareware) They include programs to show and convert R/G/B GR.9 files to APAC, GIF to APAC, AMIGA IFF images and HAM images to APAC. All of a sudden the old eight bit images are starting to look pretty good.

I'm upload a uuencoded version of APACVIEW.ARC to the net. This one will read (and convert) GIF images to APAC mode.

2414. Atari 8-bit Hardware for sale

Newsgroup: comp.sys.atari.8bit

The following items are for sale. All are in good working order and
where applicable include necessary cables and/or a power supply.

Atari 130XE, 128k Computer $100
Atari 256K 800XL Computer 125
Atari 1050 Disk Drive 80
Atari 1050 Disk Drive w/US Doubler 100
Indus GT Double Density disk drive 110
Atari XEP80 80 column board 40
ICD 1 Megabyte Multi I/O Board, with
XE Adapter, printer/modem cables 200
Magnavox 80 column mono monitor 40
SpartaDOS X 64K Cartridge 40

If you're looking for a complete 8-bit system, make me an offer on
several pieces of equipment. Buyer pays shipping!

If you can't contact me via E-Mail through Usenet or Bitnet, call me
at 716-334-4862, anytime (if I'm not there, the answering machine
is..)

Source record: 115571

Hi all. I've been hacking on another C compiler for our favorite 8-bitters, and have gotten it to the point where it's working moderately well, at least for me. This one is different than the ACE C family of compilers, in that it produces real (well, moderately real) machine code, rather than p-code that has to be run with a special p-machine interpreter. It uses an assembler that generates relocatable object modules, object libraries and a linker, just like most bigger machines.

I'm looking for a few brave souls to help me thrash the bugs out of it before I post it. If you're interested in trying it out and reporting bugs, please reply by e-mail.

>(Assuming they work together, and the docs are included.)
>-Stan

I sent you e-mail, but I'm not sure if you got it (or if you'll ever
receive it!).

The XEP80 works great with the Magnavox; in fact, that's the only thing
I use the monitor for (once I got a Commodore 1702 color monitor).
I don't have documentation for the Monitor, but I do have docs for
the XEP80. Actually, the XEP80 docs are on an Atari Disk! (I bought the
XEP80 at an Atarifair when it just came out--I don't even know if they
ever printed the docs!).

I have the monitor and XEP80 ready to ship when you give the word. I
would prefer to ship it COD, so let me know if this is ok.

If you want a sure-fire way of getting ahold of me, call 716-334-4862.
I am usually home evenings, and if I'm not, the answering machine will
be glad to converse with you.

Hope to hear from you soon ,

However, there is a version of Mario Brothers for the 7800. Since this game didn't seem to be too popular when it hit the arcades I wonder what prompted anyone to come out with Super Mario Brothers. Blind Faith I assume.

2427. Express! cartridge now shipping

Newsgroup: comp.sys.atari.8bit
Date: 1989-07-26 18:10:29 UTC
From: kimes@cbnewsc.ATT.COM
Message-ID: <2041@cbnewsc.ATT.COM>
Source record: 115581

The following message that appeared on GEnie and was reprinted in the latest Zmagazine (#166) is primarily for any of you that had the cartridge preordered. However, the information is interesting to anyone that is thinking of getting a terminal program on cartridge. It's good to know it is finally shipping.

Kit Kimes
AT&T Bell Labs
Naperville, IL
...!att!ihlpe!kimes

==========

Orion Microsystems has been shipping Express! cartridges and Keith Ledbetter made the following statement Monday in GEnie's 8-bit Bulletin Board:

"We forgot to include a cover letter with the Express! Carts that we have shipped out so far, so I'm going to post it here. If you could, I'd appreciate it if you'd pass this information on to any users on your BBSes (you can just capture this message if you'd like).

"The only cartridges that we have shipped so far have been pre-orders--we are going to use the people who pre-ordered the cartridge as extended BETA testers. We are not shipping any more cartridges until the pre-order users have used the cart for at least 3 weeks. We will then make any bug fixes that have been found, and upgrade those pre-order people to version 1.1 of the cartridge.

"So, it is VERY important that you call Chris at our voice number if you think you have found a bug--if you don't call, we won't know about it! So far, the only problems have been found in the 80-column screen handler. Version 1.1 will greatly clean up the 80-column display.

Take care,

Keith

2428. Message for Marcus Prickett - Hit 'n' if you're not him!

Sorry for this, but my mail doesn't seem to get ANYWHERE, so here's
a message for Marcus Prickett; hit 'n' now if you're not him!

Hi Marcus,

I've sent you two email messages in reply to yours, but it doesn't seem
like they're getting through! I think I've saved them, let me look...

Oh well, I must have erased them after I sent them. Anyways, I forgot
that I didn't have any docs until you asked about them (in your first
msg). I gave them to someone a long time ago and never got them back.
I know several people up here with MIO's, so I'll try to get a copy
of the docs and mail them to you.

Some things you should know! To get into the MIO firmware menu, hold
down SELECT while either turning on the computer, or pressing RESET.
To exit the menu, hit RESET or '0' (zero). The video port on the MIO
was originally going to be a port for an 80 column adapter, but ICD
scrapped the idea because there wasn't enough interest in it to be
profitable.

I received the money order today! I'm surprised the MIO got to you
today, I thought it would get to IL Friday. Not bad!!

If you need to know anything about the MIO before I get the docs to you,
give me a call at 716-334-4862.

Later,

Al

It is pretty nice. It isn't as fast as compiled Turbo, but it is faster
than Atari BASIC. It is very compatible with Atari BASIC. One of its major
advantages is the extended mode on 128K+ systems which lets you write 64K
programs which can use about 32K of data. One advantage it has over Turbo is
that it works with SpartaDOS. Otherwise, I think the additional features are
about the same, though I can't say for certain because I don't do much BASIC
programming anymore.

RE: Comparison of Basic XE versus the other Basics...

Atari Basic - I refuse to even do a comparison. Comparing Atari Basic to Basic XE is like comparing a model T to the Batmobile. :)

Microsoft - does anyone really use this in the Atari world? Basic XE does everything Microsoft does and does it better, faster, quicker and with compatibility.

Turbo Basic - Ok, here we have a contender. The only reason to buy Basic XE is because: A) you can't find Turbo Basic, B) you want to support ICD [admit it there are some of you out there, I'm one.], C) you need Spartados 3.2 and lower compatibility, D) you write HUGE programs.
I have both Basic XE and Turbo Basic. Turbo Basic is very nice, but since I also have SpartaDos I use Basic XE.
Basic XE has all the commands that Turbo does, plus several more the most important of which is the EXTEND command. When issued this command moves your BASIC program into the extra rambanks freeing up main memory for variable storage.
I prefer Basic XE but there is one very good reason to use Turbo Basic... you can compile your programs.
There is only one command I can think of that Basic XE doesn't have, and that is the TIME, TIME$ commands. I have the RTIME8 cartridge so this is no big loss to me.

2433. Textpro 3.2r

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-01 04:14:21 UTC
From: Ordania-DM@cup.portal.com
Message-ID: <20909@cup.portal.com>
Source record: 115587
Body handling: Inline uuencoded payload not displayed: TXTPRO32.FX1

Textpro 3.2r Fix

This fix is for all the nuts out there (myself included) who have managed to restore the function keys to their XL/XE computers. The 4 function keys appeared briefly on the 1200xl computer and then disappeared from future machines. They act as the arrow keys but control does not have to be held down, they also have a few other functions, but those are useless in Textpro. The code to support these function keys did not disappear and still exists in working order in the new roms.
That's the good news...now the bad, Textpro (any version) does not recognize these function keys. This is not good, I restored my function keys because I wanted to be able to use them as arrow keys without holding down the control key at the same time. This fix will make the function keys work with Textpro3.2R and maybe Textpro2.5r, it will not work with any other version of Textpro.
The authors of Textpro do not want it distributed in modified form, so you should load this fix everytime you load up Textpro. To load the fix from within Textpro, just hold down the select key and press control-W. The status line will show 'Binary Load>D:' and you just need to type in TXTPRO32.FX1 and hit return. That's all there is to it. If you prefer not to load the fix in everytime you use Textpro, you can append the fix to the Textpro file and it will be there everytime you use that version. Please don't distribute your "new" version.

This fix is being distributed via USENET and regular BBSes so there are two ways to create the TXTPRO32.FX1 file. The first way is to UUDECODE the UUENCODED version below, and the second is to type in the basic program below and run it. Both methods produce the same file.

This fix does one other thing. Since the HELP key is not used by Textpro, the fix altered its function so that it is the same as pressing control-M. You may need to hold the help key down for a moment before Textpro responds.

I will post future fixes as I finish them but if anyone sees the authors in the meantime, please tell them to contact me.

2434. Re: Monitors and stuff

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-03 14:43:05 UTC
From: slackey@bbn.com
Message-ID: <43734@bbn.COM>
Source record: 115589
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm

I am using a "mid-res" monitor I got from Sears, not sure of the actual make. It has two inputs: a composite video input, and a (I think) IBM PC TTL input (the eight or so conductor, square shaped connector). There is a switch in the front, labeled RGB/Composite.

Normally, I use the composite input with the standard Atari video out. (The image is sharper that a regular TV, but still has lots of color artifacts if you attempt half-color-clock vertical widths, for example using PLOT-DRAWTO in gr.8 to draw a vertical line).

I just acq'ed an XEP80, which has a composite video out. If I attempt to connect its output to the monitor's composite input, I get bad color artifacts, and the text dosen't fit on the screen (although much more will fit on this monitor's screen that a regular TV screen).

I would like to use the PC input for the XEP', and the regular comp input, and be able to swith at will between the XEP' and the normal Antic outputs. Does anyone know if this is possible, and/or what I need to do? Did I get all those parentheses right?

-Stan

There is presumably a modification floating around which will allow
you to hack the XEP80 to add a TTL-type output. The modification was written
by a user of CompuServer, Bob Woolley. I'm not sure of the name, but if you
or someone you know has access to CI$, you might try the ATARI8 SIG's file
libraries.

Well I got APAC/GIF off the net, and I asked if anyone could post some
pictures for it. I got the following suggestion:

In article <4033@udccvax1.acs.udel.EDU> gdtltr@vax1.acs.udel.EDU (Gary D Duzan) writes:
> If you have access to FTP, one place you can get GIF sample pictures is the
>SIMTEL20.ARPA archive. Do a cd to PD1:<MSDOS.GIF> and there they are. Use
>"anonymous" as your user name and it should let you right in.
> Gary Duzan

Well I tried it, got in, found some *.GIF which I copied, and they
didn't work. APACVIEW responded with like "Not GIF Format" or the
equivalent. Just for laughs I tries unarc/crunch'ing them, and it
seems they aren't arc'ed. Any suggestions? Or would someone be
kind enough to pack up a few and post them? I'd love to see how
well APAC works.

BTW I did try COLORS.GIF which was in APACVIEW.ARC, it displayed,
but it was difficult to tell what APAC was trying to demonstrate
with it. It did work though.

I'm sure this topic has come up before, but I kind of missed the out come of the discussion...

If I upgrade my disk drive with the US Doubler this will give me true "double density" which is a 180K floppy...correct? If this is correct, would it possible for a standard(180K) IBM floppy to read my atari disk??? Would it be possible for an IBM to write Atari Dos Format with the right program????

Well the Time$ function in turbo basic is set for the european 8-bits at
50khz instead of the normal; 60khz for us americans so the clock runs a bit
fast..
I never did get the 850 interface to work with turbo basic either..
Had i been able to I never had used basic XE and found out how good it really
is. It precompiles the addresses which makes your program extremly fast..
Basic XE ias the ONLY basic for the 8bit computer series.
Although i would have liked it if they put it in a "super cart" so the
didnt have to be loaded off disk..

There should also have been some documentation (text) files--at least one. It describes what the COLORS.GIF file is for. It is a reference to use to set your monitor colors. I was surprised at how much of a change I had to make with my monitor/tv to get the colors to match the discription in the text file. It did seem to help the color of the GIF pictures I have, although seemed to have little effect on the TV viewing. BTW, I got most of my pictures at our Users group meeting. That is another good source (if there is a meeting near you).

From: Hugh_E._Wells.ElSegundo@XEROX.COM
Message-ID: <890804-114131-3011@Xerox>
Source record: 115595

It appears that the XF-551 disk drive has an inherent controller board problem which causes the drive to go to sleep. This caused me to open it up and attempt to find the difficulty. I really need a schematic diagram.

Although I haven't located the problem as yet, I did notice that the drive mechanism is a standard IBM 1/2 height 5-1/4 drive which is easily replaced -- plug compatible. I appreciate that fact as 1/2 height drive mechanisms are readily available.

I would appreciate any info available on XF-551 schematic diagrams and/or how to resolve the sleeping problem.

Thanks,

Hugh Wells

Did you set the proper transfer mode before getting the files. If you use
binary mode, it probably won't work. simtel20 is a DEC machine with an evil
word size of 36 bits. What you probably want is type tenex.

This is explained in some README document on simtel20 in the login directory
if you want more info on the topic.

Not quite, the standard IBM format is 360K which is DS/DD. While it is possible to format IBM disks single sided, I have yet to find a reason to do this other than to format 3.5" disks for Atari ST's with single sided drives. As for having the data being read back and forth between computers. The only thing that I have heard of doing that is an ATR-8000/8500 with the 8088 coprocessor (the reasoning is obvious, you can boot up MS-DOS with it) and a Happy Enhanced drive. There's no other way to my knowledge of doing it and before I went and bought an IBM XT clone I was a devout Atari 8-bit user with a good 130XE system. You'd also have to dig around to find out how Atari disks are formatted, just because the capacities are the same doesn't mean they use a compatable format. You have two different drive controllers that expect tracks and sectors to be laid out differently (most likely). It wouldn't surprise me if Atari deviated from the standard Western Digital and NEC 764 drive controller schemes.

When will this end??? :)

Yes, tis I again, your faithful Textpro modifier. Just giving you fair warning that I will be posting a fix for textpro (3.2r again) to allow the slash (/) functions to work correctly. I also wanted to let you know that my previous posting will NOT work with textpro 2.5r, I tested it and it didn't work. Later on I will post the fix for 2.5r to use the function keys.

NEWS: Mike Collins or Ronnie Riche (one of the two) has 'reappeared' (at least according to Zmag 167) and will be making a new Textpro. He is asking for input on what everyone would like to see. If you have an idea of what you would like to see, send it to me (or
to him if you are on Compuserve) and I'll do my best to make sure he gets it.

> [about the USDoubler giving 180k storage capacity, and asks whether
> this allows data interchange with the IBM PC]

Just another observation that the Happy upgrade now allows 1050 owners to both read and write single-sided PC-DOS diskettes. (The diskettes have to be *formatted* on a real PC clone, because the 1050 can't sense the index hole, but some PC clone disk controllers get upset if the index hole goes flying by at an unexpected area on the disk.) I have it, and it works.

My understanding of the US Doubler is that it can do 256-byte sectors, but not the 512-byte sectors used by PC-DOS.

2446. Re: Textpro 3.2r

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-07 07:32:03 UTC
From: Ordania-DM@cup.portal.com
Message-ID: <21098@cup.portal.com>
Source record: 115602

Yet another of my fixes....here is TXTPRO32.FX2:

TXTPRO32.FX2

Feel free to distribute this fix via modem, newsletter, etc but please
don't alter it. If this is distributed via newsletter, I sure would
appreciate a copy.

This is the second fix file for Textpro 3.2r in as many weeks. It is
updated, and contains only a BASIC program this time. After I finish
modifying 3.2r I will try to create the same mods for 2.5 and 1.2, so if you
are using one of those, you'll just have to wait.

This fix is for all the nuts out there (myself included) who have managed
to restore the function keys to their XL/XE computers. The 4 function keys
appeared briefly on the 1200xl computer and then disappeared from future
machines. They act as the arrow keys but control does not have to be held
down. They have shift/control uses and these were kept if at all possible.
The code to support these function keys did not disappear and still exists|
in working order in the new roms.
That's the good news...now the bad, Textpro (any version) does not
recognize these function keys. This is not good, I restored my function
keys because I wanted to be able to use them as arrow keys without holding
down the control key at the same time. This fix will make the function
keys work with Textpro3.2R but NOT with any other version of Textpro.

For SDX users:
This fix patches the slash ('/') commands so that they now work correctly
under SDX. The lockup problem is under investigation, soon as I find it,
I'll post the fix.
The SDX patch will not hurt Spartados 3.2r users, so you can go ahead
and use this fix normally.

Corrections:
This fix patches the Select-Control-Z and Select-Control-X functions.
X turned the screen off, and Z turned it back on. I felt this was a waste
so now both Z and X toggle the screen display. Perhaps later the Z can be
used for something else.

Function keys:
I added some additional patches to utilize the function keys more.

Keyboard Commands:
At the end of this file is an updated version of the keyboard commands
for Textpro 3.2R.

HELP key:
This fix does one other thing. Since the HELP key is not used by Textpro, the fix altered its function so that it is the same as pressing control-M. You may need to hold the help key down for a moment before Textpro responds.

Since the authors of Textpro do not want it distributed in modified form, you should load this fix everytime you load up Textpro to prevent a modified copy from being distributed accidentally. To load the fix from within Textpro, just hold down the select key and press control-W. The command line will show 'Binary Load>D:' and you just need to type in TXTPRO32.FX2 and hit return. That's all there is to it. If you prefer not to load the fix in everytime you use Textpro, you can append the fix to the Textpro file and it will be there everytime you use that version. Again, please don't distribute your "new" version.

I will post future fixes as I finish them but if anyone sees the authors (Ronnie Riche, Mike Collins) in the meantime, please tell them to contact me.

2448. Turbo-Basic clock fixes

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-08 00:40:16 UTC
From: hans@umd5.umd.edu
Message-ID: <5168@umd5.umd.edu>
Source record: 115604

I was on vacation when the recent discussion about that topic took place,
so please forgive the delayed response.

Following is a copy of an article which I posted a long time ago, when
Turbo Basic first came out.

Two notes: My explanation of time setting is incorrect, the correct way is
TIME$="hhmmss", as was previously discussed here.
The changes are given in hex, for those of you who have the appropriate
tools, and also based on the binhex file which was used for the original
distribution. If someone would like to use this, but doesn't have the
appropriate tools, let me know, and we'll see what we can work out.

To: comp.sys.atari.8bit
From: hans
Date: Thu, 15 Jan 87 16:11:00 EST
Subject: 60 Hz mods for Turbo Basic

The Turbo Basic interpreter which was posted recently assumes 50Hz vertical
scan rate for its timing functions, and therefore gives erroneous results.
Following are changes which should rectify that situation.
Warning: I have arrived at these by looking at disassembled code, and have
not had a chance to test them.

Apparently there is a statement of the form
TIME HOURS,MINUTES,SECONDS
to set the time. It multiplies seconds by 50 to get the jiffy count. It is
simple to change that to a multiply by 60. To do the exact conversion would
require somewhat more work, and I am not able to do that at this point.

Address old new
FBA6 F2 16
FBA7 FB FC . change JSR $FBF2 to JSR $FC16

If you want to change the BINHEX file, change line 946 (counting .start. as
line 1) from
FC20C4FBC93CB01C20DEFB20F2FB20ECFBA5

____
to
FC20C4FBC93CB01C20DEFB2016FC20ECFBA5
Of course the checksum will be incorrect after you do this.

The TIME function returns the current jiffy count.
The TIME$ function has a constant of jiffies per day built in, at address
FB6E to FB73. The built in value is $430432000000, or 4320000
(which is 50*60*60*24). This could be changed to one of the following:

a. $430518400000 for a scan rate of 60 Hz.
b. $430517882052 for a scan rate of 59.94005233 Hz.
c. $430517737658 for a scan rate of 59.92334 Hz.
The first case has the advantage of being compatible with the TIME command above, but it will make the clock loose about 86 seconds per day.
The second case uses the standard scan rate (see recent rec.video and comp.graphics posting).
The third value is taken from "Mapping The Atari", Revised edition, page 182. I do not know what its justification is. The difference between b and c should be about 24 seconds per day, the difference between a and c about 110 seconds per day.

To make the change in the BINHEX file, change line 943
from
05E6F260410256000000430432000000200O
---
and fill in your favorite value.

I have no idea how accurate the crystals in Ataris are. And then there is the problem of loosing scan counts when VBIs are disabled ...

Again: I hope this is useful, but I have NOT had an opportunity to test it.

Here is a gaming survey my new partners and I put together. we are trying
to get a feel for the Computer gaming atmosphere to help us in producing
our first released game.
This survey will be held in confidence so please answer the questions
honestly.

I will post a summery to the news groups that show enough interest.

Thank you for your help
Steve
---

1. Do you play computer games (obvious question)

2. Do you play board games?

3. Do you play non-computer role playing games?

4. Of the computer games you play, do you play...

a. Role playing games (fantasy)

b. Role playing games (sci-fi)

c. Arcade type games

d. Strategic/tactical combat

e. Strategic/tactical sci-fi

f. Mystery/detective

g. Flight simulator/combat

h. Other type (please describe)

5. Of the above types of games what type do you play most.

6. On average how long do you play a game before shelving it
(how much playability is there in your games)

7. Do you have any games you purchased?

8. Do you have any pirated games?

9. Do you write your own?

10. Do you have mostly (a) purchased (b)pirated or (c) self made games

11. What is the most you spent on a game?

12. Was it worth it (in comparison to the price of other games)?

13. What do you think is a fair price for most games?
(considering packaging, marketing, royalties ect)

14. How often on average do you purchase games?

15. Do you have any PD games?

16. Have you ever sent any money on a share-ware game?

17. Do you play games mostly with other people or alone?

2451. DOS 3

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-08 18:01:53 UTC
From: mfolivo@sactoh0
Message-ID: <1698@sactoh0>
Source record: 115607
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I am primarily posting this to comp.sys.atari.8bit, but perhaps someone at Atari Corp who reads ...atari.st might help.

Probably being one of the last DOS 3 users in the Western World (not counting all the 8bits shipped to Poland (heh)) I have wanted to know the file structure, etc. of DOS 3. DOS 2 has been widely documented, but I have found nothing on DOS 3. The only technical information I have about DOS 3 is that the directory is on the first sectors (rather than in the middle of the disk- DOS 2) and that DOS 3 stores files in 8 sector groups called blocks (1024k).

Is there (Are there) any technical notes or source documentation or anything on DOS 3? Who wrote DOS 3? Was it in house Atari, or was it an OSS effort?

Please, no flames. I mainly use my Mega 4, I don't want to buy another DOS (read: from ICD), all my 8 bit files are DOS 3 (I tried DOS 2.5 but went back to DOS 3). I would like to have some background information on how DOS 3 works. (Bugs? What bugs? I certainly haven't found any bugs... ANd no one complains that GEMDOS (ST) uses 512k blocks...)

Mata ne da-cha,
Mark Newton-John

2452. SX212 Atari 1200 baud modem for sale!

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-10 21:35:31 UTC
From: aegnor@bsu-cs.bsu.edu
Message-ID: <10013@bsu-cs.bsu.edu>
Source record: 115588

Hello all, I have on of the SX12(?) variety of modems made by Atari (I am at work and can NOT remember the exact model number at the moment...;-))

It is Hayes Compatible, has the RS232C (db25 connector) PLUS the SIO port to hook directly into an 8-bit Atari, and it is 1200/300 baud.

I will sell the modem, (with the original box, manual etc.) + a copy of Kermit WITH the SX handler built into it (so YOU 8-bitters can use it right out of the box!) and the SIO cable for the following:

I would like to get $70.00 + shipping (should not be more than a couple of bucks UPS ground...) I paid $95.00 sans the cable/software last year, so I think this price is fair. I am also willing to take offers, drop me a line and we will talk turkey! [BUT if I can't get NEAR what I want out of it, I will probably just keep it....]

2453. Antic

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-12 01:29:56 UTC
From: wilmott@topaz.rutgers.edu
Message-ID: <Aug.11.21.29.52.1989.4246@topaz.rutgers.edu>
Source record: 115597

As any subscribers to Antic know, the mag has gone to a disk-only format. A reply card was sent to subscribers letting them know and explaining that for those subscribers who absolutely did NOT want the remainder of their subscription converted to disk "special arrangements" would be made if they requested. Well I did request it...immediately. But Antic has now sent 2 issues of the disk version anyway and has informed me that my subscription had run out. I've written them about this, but they ignore me. Has anyone else had the same experience. I *probably* would have converted to the disk subscription has Antic honored my request and honored the original terms of my subscription (namely "*twelve* issues"). As it stands, I think I'll just ignore them the way they are ignoring me...

From: rfc@briar.philips.com
Message-ID: <61596@philabs.Philips.Com>
Source record: 115611

Some time ago, on a disk of some PD software, I got this DOS 2.6
Never heard of it mentioned in any list of DOS's.
It's a good DOS, and it has commands to copy specified sectors, check drive
speed, translate hex to decimal (and visa versa) numbers, and turn write
verify on or off. and some more. It looks like an enhancement of DOS 2.0
Far as I can tell, it's probably public domain, or at least copyable.
If true, I could make anyone
interested copies. Send a formatted disk SASE to:

Robert Casey

Oradell NJ 07649

2457. XF-551 Disk Drive

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-15 15:43:42 UTC
From: Hugh_E._Wells.ElSegundo@XEROX.COM
Message-ID: <890815-120454-16753@Xerox>
Source record: 115610

I received a note requesting more info on the sleeping problem of the XF-551. I responded directly to the writer but my message did not go through and was returned for some reason.

The original posting is as follows:

"It appears that the XF-551 disk drive has an inherent controller board problem which causes the drive to go to sleep. This caused me to open it up and attempt to find the difficulty. I really need a schematic diagram.

Although I haven't located the problem as yet, I did notice that the drive mechanism is a standard IBM 1/2 height 5-1/4 drive which is easily replaced -- plug compatible. I appreciate that fact as 1/2 height drive mechanisms are readily available.

I would appreciate any info available on XF-551 schematic diagrams and/or how to resolve the sleeping problem."

For additional info, I'm aware of three XF-551 drives owned by three different individuals that are experiencing sleeping type problems. Judging from that I would expect a design flaw to be the cause. My particular drive had a sleeping problem which was intermittant at first where the drive failed to react to a command for short periods, but otherwise worked correctly.

Now, my drive has degraded to the point where it fails to respond at all. I have diagnosed the problem to the extent that it is the controller board at fault and not the mechanism/board.

To solve the problem, would be for Atari to design a fix for the sleeping condition. The chances of that happening, I expect, are pretty remote. Therefore, I would settle for a schematic and/or a replacement controller board.

Any assisstance in obtaining troubleshooting info, schematic, replacement board, etc. would be much appreciated.

Thanks,

Hugh Wells

2458. MIO questions

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-16 14:14:32 UTC
From: briann@tekigm2.MEN.TEK.COM
Message-ID: <5812@tekigm2.MEN.TEK.COM>
Source record: 115612

I am considering buying an MIO from ICD. The problem is that I want the 1Mb version but they cost $470! Too much by my standards. The 256Kb version sells for $260 and is much more reasonable. This raises some questions on my part. Can the 256Kb version be expanded to 1Mb by adding memory chips or are the two versions entirely different? Also, to get around this problem entirely, is anyone interested in selling their 1Mb version to me?

Brian

My question is WHY, WHY, WHY would anyone want to expand an 8-bit Atari? I loved my 1200XL, I even gave my brother an 8-bit system for christmas. ($200.00 bucks for an 800XL, XF551 and a NINTENDO Game (Zelda!) is an excellent deal, even today.) However, a friend of mine was (is) contemplating expanding his 130XE to one meg, and maybe buy a hard disk, 80 column card, etc. AND I TRIED MY BEST TO TALK HIM OUT OF IT!!! For the price of expanding an 8-bit, you could afford an ST or an Amiga.

Atari has (apparently) abandoned the 8-bit line like it was a bastard child. When was the last time new (exciting) products were introduced for the 8-bit. Of those, how many require more than 64K?

I don't believe anyone should throw his 8-bit away, I just don't see the reason for expansion...

2460. Modem accessories revisited

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-16 20:09:00 UTC
From: danmcd@caen.engin.umich.edu
Message-ID: <4511a7da.b450@ferrari.engin.umich.edu>
Source record: 115614

Thanks for the response to my first posting on this subject. Perhaps
I should explain my situation:

I have a 130XE with two unmodified 1050 drives, and a printer
whose interface (remember the Ape-Face) ends the daisy chain.

I also have a Macintosh, with a Hayes-compatible 2400 baud
external modem.

I'd like to use the modem on BOTH systems.

I will be acquiring a terminal program in the near future (Thanks to
this guy at Philips whose name I can't remember). What I need is something
like a P/R connection or something like that. Now the big question:
"Does anybody have one for sale, or know where I can get one, CHEAP?"

You know where to E-mail your responses. Thanks again!!!

2461. Re: MIO questions

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-16 21:19:16 UTC
From: briann@tekigm2.MEN.TEK.COM
Message-ID: <5824@tekigm2.MEN.TEK.COM>
Source record: 115615

In article <30677@ucbvax.BERKELEY.EDU> mitchell@janus.UUCP (Evan Mitchell) writes:
>My question is WHY, WHY, WHY would anyone want to expand an 8-bit Atari?

Well, here are my reasons:

1. I don't have any ***real*** use for a computer at home except to
play with and play games on. This does not justify buying another
different computer.
2. I have gobs of software that I purchased for my 8-bit and I can't
justify starting over and buying software for a new machine.
Software for the 8-bit is cheap now, ST or other software is not.
3. If I need to do real DTP or SPICE or heavy document writing, then
I will use the Suns or mainframes at work. Why should I buy a new
machine to do these kind of things when all I have to do is stroll
into my office and use real computers for free?
4. My 8-bit is my current toy that I hack on. For this reason, I do
not want to buy a new machine. I enjoy playing with it. This
justifies expansion. The cost of expansion for my 8-bit is
far less than buying a new machine and software.

My question is, "WHY, WHY, WHY is anybody asking why I would want to
expand my 8-bit?" If you'll read my post, you'll notice that I didn't
ask for opinions on whether I should do this or not, I asked if and how
this can be done. Sure, my 130XE is a toy compared to what's out there
today, but it came in handy in college writing papers and as recreation
to occasionally escape from my studies. Now it serves as a hobby. Is
that OK with you, Evan? Sheesh...

Brian

=>
=>Brian

From what I have heard, the 256K and 1 Meg MIOs have different ROMs, making them incompatable. I have heard of a way to upgrade it, but it requires the ROMs from a 1 Meg MIO, which can only be legaly acquired from ICD. I have heard rumors of an ICD upgrade policy, but can't confirm it.
If you are planning on getting a Hard Drive, you could probably live with the 256K model, and it would save you money. Not that the Meg version isn't useful (the RAM is a lot faster that any drive), but if you are looking for mass storage with a reasonable speed, a 256K with a HD should do.

In reference to another response to the root message, I agree that it is a bit silly to apply internal RAM upgrades such as the 1 Meg XE. The only real use for that RAM at this time it RAMdisk, which gets zapped when you turn it off. The MIO, however, is a good tool for hacking with. An MIO can do a world of good for a BBS. I will (hopefully) be using mine for some software development.

Date: 1989-08-18 23:58:11 UTC
From: gdtltr@vax1.acs.udel.EDU
Message-ID: <4198@udccvax1.acs.udel.EDU>
Source record: 115624

The following is from the DataQue support BBS:

Date: 08-02-89 (23:34) Number: 8
To: ALL Refer#: None
From: SYSOP Recv'd: (n/a)
Subj: STATUS Sec'ty: Public Message

Current Status of the Turbo-816:

The smaller version of the Turbo-816x is now at the board house, and
should be back in a few weeks.

The SRAM board is also out on the same order as the T816x boards, and
should be back about the same time. As soon as they get me the prices
I will put them up here.

Due to some noise problems when certian MIO units are connected to the
PBI interface, I am investigating various solutions. Initially
Bob Puff & I thought of a buffer board, but it ended up being to
difficult to manufacture, and Bob had limited success getting the
buffer board to work with non-t816 due to the additional propogation
delays. Another solution, which seems to work, is to add bypass
caps to certain lines.

add 100pf (pico-farad) bypass caps to the R/W line, Phase-2 line,
and see if that helps the problem, if not, try adding bypasses of
the same size to the data bus. as a last resort, the address bus.
these caps are usually very small, and if anyone finds a source
for SIP style, let me know.......

Msg(s) [1 - 13], [F]rom, [S]ince, [Y]our, [N]ext, [P]revious, [H]elp
DataQue Conference Message Read Command [C/R]=none? n

Date: 08-02-89 (23:41) Number: 9
To: ALL Refer#: None
From: SYSOP Recv'd: (n/a)
Subj: PROM Sec'ty: Public Message

Version 1.1 of the Turbo-OS will become available this week. It is
now in the very final test stages, and only checksum balancing
needs to be done.

many improvements have been added, including a much superior memory-
management algorithm for the expanded memory type. also a better
test algorithm for extended (xe-banked) ram was added, resulting
in more banks available for >256k machines. A few minor bugs

that slipped past the beta testers were also corrected.

there are now approx 100 t816 installed world-wide. not a gangbuster count, but considering the infancy of the project, not bad I feel.

Turbo-Calc is still being worked on.... a few minor problems popped up, which are being looked at.

Alf-ASM for the T816 is being developed by Jeff Williams, and Bob Puff and look for it to become available sometime within a month or two. this asm will support all native mode op codes, and hopefully full external/public module linking.

Msg(s) [1 - 13], [F]rom, [S]ince, [Y]our, [N]ext, [P]rev

Now for the question. I'm not much of a hardware hacker, so could anyone explain to me what the above MIO fix procedure amounts to? Thanx.

2471. bobterm part 1 missing - HELP

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-21 14:53:04 UTC
From: den@hpfinote.HP.COM
Message-ID: <19810001@hpfinote.HP.COM>
Source record: 115625

Does anyone have part 1 of the 2 part Bobterm posting? I finally got a way to get it to my 800XL and just discovered all I have of version 1.10 is part 2 of 2. Please post or email.

Thanks in advance,
Don Novy

2472. 1 Meg 130XE for sale

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-22 22:02:00 UTC
From: derhak@wasatch.utah.edu
Message-ID: <3091@wasatch.utah.edu>
Source record: 115626

This message is for a friend of mine. He is selling a 130XE with internal memory upgraded to 1meg + 64k. The upgrade was Designed by UPGRADE PRODUCTS. Some of its features incluce.
- Modified OS in ROM that accesses the extra memory as 11 selectable ramdisks compatable with almoast ALL DOS's.
- Beefed up powersuply which supports batter backup. (Requires a Motercycle batery, and a battery recharger.)
- Operating system is selectable between Stock OS, and UPGRADE OS.
- User Selectable Memory Protection of:
* Ram Operating System (Translator Memory) C000-DFFF, E000-FFFF
* Cartridge A A000-BFFF
* Cartridge B 8000-9FFF
- Liscenced Copy of Omnimon 4k on disk to be loaded and protected via software switch.
- This machine is so versitile that you can use BASICXE, and built in ramdisk handler with no problems.
- A switch to force operation in ram os mode reguardless what is stored in D301 bit 0.
- Software to check memory, and save operating system.
- Tons of Documentation about the upgrade comes with it.

He is asking $300.00 plus the price of shipping for the computer and power supply. NOTE: He origionally paid that much for the UPGRADE alone!

Please email your responses to me at derhak@wasatch.utah.edu.
or call him at 1-801-968-9133.

Message-ID: <8908232101.AA18894@ucbvax.Berkeley.EDU>
Source record: 115629

I joined the list in the summer and was merely assuming it was due to the slow-down common to this time.

I was wondering why there were no INFO-ATARI8 digests forthcoming (I still get deluged with INFO-ATARI16). I hope the machines aren't extinct as they are nice to hack around with, without having to worry about munging my more expensive and less bumbler-tolerant ST :-).

Anyone else out there?

- Brian

2476. hooking up an 850 to my suprea modem

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-25 12:53:31 UTC
From: FNMELNIK@WEIZMANN.BITNET
Message-ID: <8908251306.AA26259@ucbvax.Berkeley.EDU>
Source record: 115630

Hi,

I recently purchased a supra 2400 bps modem. I am trying to hook it up using an 850 interface that I got second hand..problem is that I dont have the cable needed to connect the 850 (9 pin serial) to the modem (25 pin Rs-232)..does anyone have the pin layout for this job ..c i was loking through some guide and there is no set standard for a 9pin rs232...

any help building this cable would bve grreatly appreciated...

Thanx,
-Ofer

>Rs-232)..does anyone have the pin layout for this job ..c i was loking
>through some guide and there is no set standard for a 9pin rs232...

The pins on port #1 are:

1 DTR (Data Terminal Ready)
2 CRX (Carrier Detect, CD)
3 SD (Send Data)
4 RD (Receive Data)
5 GND (Signal Ground)
6 DSR (Data Set Ready)
7 RTS (Request To Send)
8 CTS (Clear To Send)

Ports 2 and 3 are the same, except that they don't have 2, 7 or 8 connected.
Port 4 has 1,3,4,5, and 7 connected, plus a -8v connection at pin 9.

Source record: 115635

In reply to the msg about upgrading an Atari 800 to a full 64K, It can't be d
one without a major reworking of the computer. The Atari, being an 8-Bit
computer, can only access 64K of memory at one time. In the XL's and XE's
with 64K, only 48K is easily accessible at one time. To access the other 16K
that is "under the OS", mapped in the memory where the OS is, you must use
location $D301 of the PIA. Its 8 bits are used to turn internal Basic on/off,
turn OS on/off, turn Diagnostic Rom on/off,or select extra RAM (above 64K) if
there. The Atari 800 has this location of the PIA controlling joysticks 3&4.
To change it would require the newer OS out an XL be put in the 800, and
something would have to be done with internal Basic and the diagnostic ROM.
It would be so mush easier to buy an XL or XE. (Analog Mag has an ad for an
Atari 1200XL for $50.00!!!)

Ah! Finally found my old DOS 3 manual! And now...

ATARI DOS 3 REFERENCE MANUAL ERRATA

05/01/84

MANUAL CORRECTIONS

PAGE 14, In the 'INTEREST' program, line 200 reads:
200 LET A=P*(1+R/100) N
Change to:
200 LET A=INT(P*(1+R/100)^N+0.5)

PAGE 58, 'code 13', reads:
13 = input and Output operation; positions file pointer to EOF; writing
past EOF is allowed.
This line should be:
13 = input and Output operation; positions file pointer to BEGINNING of
file; writing past EOF is allowed.

PAGE 60, gives information on Random Access methods. The program indicates
that only the 'X' parameter is significant, actually both the 'X' and 'Y' para-
meters are significant. For a correct demonstration of the Random Access NOTE
and POINT commands contact ATARI Customer Relations at the address listed
below.

PAGE 65 and 66, the 'BIRTHDAY' program requires several changes:

Line 140 reads:
140 IF MONTH 1 OR MONTH 12 THEN?ERR$:GOTO 100
Change to:
140 IF MONTH < 1 OR MONTH > 12 THEN?ERR$:GOTO 100
Line 240 reads:
240 NEXT
Change to:
240 NEXT I
Line 310 reads:
310 IF A$ >< "YES" THEN GOTO 20
Change to:

```
310 IF A$ <> "YES" THEN GOTO 20
Line 340 reads:
340 ? "PLEASE TYPE PERSON'S BIRTHDAY (MM-DO-YY)"
Change to:
340 ? "PLEASE TYPE PERSON'S BIRTHDAY (MM-DD-YY)"
Line 390 reads:
390 TRAP 400:XIO 36,#3,0,0,FILE$:OPEN #,9,0,FILE$:GOTO 410
Change to:
390 TRAP 400:XIO 36,#2,0,0,FILE$:OPEN #2,9,0,FILE$:GOTO 410
Line 620 reads:
620 IF MONTH 12 THEN MONTH=1
Change to:
620 IF MONTH > 12 THEN MONTH=1
Line 700 reads:
700 EOF=0;GOTO 600
Change to:
700 EOF=0:GOTO 600
Line 3000 should be omitted.
```

ATARI DOS 3 ANOMALIES

Early versions of ATARI DOS 3 used a random access method that was incompatible with large files. To determine if you have an early version, boot your copy of Atari DOS 3 with ATARI BASIC, and execute the following command from ATARI BASIC:

```
PRINT PEEK(1816)
```

If the value returned is '53', your copy of ATARI DOS 3 is a current version and does not require modification.

If the value returned is '51' or '56', please contact ATARI Customer Relations at one of the toll free numbers or address listed below, to obtain a program which will update ATARI DOS 3 to the current revision level.

If you want to receive additional information on the structure of an ATARI DOS 3 diskette, and how ATARI DOS 3 manages diskette files, or if you have any other questions concerning ATARI DOS 3, please contact ATARI Customer relations at one of the following toll free numbers, or address:

ATARI Customer Relations

Message-ID: <451@ariel.unm.edu>
Source record: 115638

Hi all,

I am looking for any information that could help me locate
a couple of items..

First, I guess I should tell everyone about my setup here.
I have an Atari 130XE (not expanded), two 1050 disk drives, an SX212 modem,
and an Okimate 10 color printer. Then, I have a Commodore 128 with a
1571 disk drive and an RS232 handler so it can use the SX212.

WARNING!! The following is just my opinion...the real reason I am posting
follows this..
.....
(It's (the 128) really
just a game machine for me since noone ever learned how to use the Atari's
graphics and sounds for games...such as the Ultima series. The atari is
for things like school work, communications, and high speed games, ie: Flight
Simulators [The Commodores may have easy to display colors and such, but
they are really quite slow!] You may ask why I hooked the Commodore up to my
modem when I use the Atari for communications, well it's because the
vt100 emulator allows color changes....I'm tired of a white screen on the
Kermit vt100 emulator...plus it has Xmodem, and now that I have a Unix
xmodem I can transfer files much faster from school to home...)
.....

Anyway what I want is:

1) A monitor, especially a Commodore 1902 monitor.
I want to hook up the Atari and the C128 to it, using the
Composite part for the Atari and the C128, and the RGB part for the 128's
80 column mode...
This I need as soon as possible!
If you know of another monitor that handles both Composite and
RGB in color get in touch with me!

2) A printer that can handle both the C128 and the Atari, more than likely
using RS232, and is VERY fast, not too bad on letter quality and
programmable for graphics. If you know of any printers that can
do even part of this, contact me.

To reply, feel free to just Followup, as carina isn't handling email
correctly yet...

Thanks a bunch,
Marc

2485. Re: dead-list..???

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-31 11:01:01 UTC
From: UCPL030@UNLVM.BITNET
Message-ID: <8908311018.AA04330@ucbvax.Berkeley.EDU>
Source record: 115639

Well, not dead, but mighty quiet.

I have older 8-bit machines, both a 400 and an 800, the latter is used mainly as dial-in-to-mainframe, but still fun with the occasional game.

One project started years ago with some friends, but set aside when they went on to bigger machines, was an attempt to network several Ataris, not as in a LAN, but actually running as one game system, with slave Ataris acting as displays to one main system as the game driver. Multi-player games have always been of interest to me, and the thought of invidual Atari screens each being a cockpit view of a plane in a dogfight, or a station on the bridge of the U.S.S. Enterprise...

Original attempt explored both PIA port connections and the serial port, but problems with signalling interupts seemed to be high on the list of obstacles. Anyone having ideas or interest in this subject should probably post to the list. We're trying to generate discussion, right?

UPGRADING 800 to 800XL:
My hardware knowledge is pretty limited, ergo the moribund project I just described. However, I'm pretty sure that a new OS is required, but not the only change you'd need. For one thing, I remember hearing about upgrades to the screen display chip(s). The XL's 'sharper, brighter' screen was one of it's big selling points. Whether tis necessary, or cosmetic, I have no idea.

Lastly, where are you planning on sticking the extra 16K board? I don't think you can just slap in a 32K board in one of the regular slots.

I love my lil ole 800, but with the prices I've seen, I suggest looking for XL to purchase over trying to upgrade. Adding a different keyboard(the one thing I decided was worse on the XL) to the XL would be a lot easier.

I think a good way to do this, albeit slow, is to use VBI and/or DLI
as a 'timebase', and build a simulated UART using the controller ports.
Received data can even go into a queue, so that data isn't lost while
the CPU goes into a long latency operation.

Does anyone know if the VBI is synchronized to the power line? If so,
one-bit-per-VBI is possible, even if the two ataris happen to be
plugged into opposite phases. It seems with some care, one BYTE per
VBI might be possible (if the synchronization is there).

I have used the internal timer interrupt for stuff like this, in
particular my mouse/trakball driver. There were interactions, though,
when I turned on DLI to twiddle the screen; at least a few DLI
interrupts were lost, and some VBI's were lost, resulting in a lot of
screen flicker because the VBI/DLI's sometimes weren't doing their
respective thing. What I ended up doing was to put a DLI on every
[text] line, and in the DLI routine inc a line count and check for (do
I do something this time?), and not using the timers at all.

2487. 1030 Modem info

Newsgroup: comp.sys.atari.8bit
Date: 1989-08-31 17:09:00 UTC
From: hulse@iris.ucdavis.edu
Message-ID: <5238@ucdavis.ucdavis.edu>
Source record: 115641

I am looking for technical info on the Atari 1030 modem. I've had the thing for a few years, and I've been waiting until I had the time to mess with it. As I enter graduate school, I realize that time will never come, so I'd like to start now.

Specifically, what commands will the handler recognize? Is there a way to connect the audio line from the 800 directly to the phone line (if so, I could hang and A/D off of it, back in through the joystick ports, then put the modem in auto-answer mode, answer the phone with a speech synthesizer, and digitize the messages (or even use an old cassette player, but how to make it rewind)?

Thanks, in advance,

Source record: 115644

I'm not exactly sure how to do it, but there is a book out (I't may be
hard to find) called Mapping the Atari by Ian Chadwick (I think) that tells
a great deal about the Atari OS as well as listing most of the memory addresses
in the computer. There is also a section telling some of the differences
between the old 800's and the XL's. You might try giving this book a try.
To tell you the truth though, it would probably be easier to just buy
an 800XL and not worry about it. You can buy one for around $60 or less if
you look. Or why not just upgrade to an ST?

Good Luck,
Kent Covert

On the XL, XE's at least, the power suply generates DC voltage for the
computer, and therefore is in no way synced in with the power line.

Your best bet would be to use Pokey timer interupts.

Max

Is there a way that your friend could post it on the net? I know that there are a few of us up here that would like to check it out. I'd also like to submit it to the local Atari user group library (I am a director and 8 bit co-ordinator for the Vantari User Group).

2495. Atari 8-bit forth debugger

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-03 09:42:16 UTC
From: ttensfeldt@eagle.wesleyan.edu
Message-ID: <924@eagle.wesleyan.edu>
Source record: 115649

A friend of mine has written a screen oriented FORTH debugger for the ATARI 8-bit computers. He tried to have it published by ANALOG Computing, but the editors felt that it was too long, and would have limited appeal. I guess they don't get enough FORTH articles submitted.

In any case, he'd like to encourage FORTH activity among the ATARI 8-bitters so he's wants to give it away to anyone who wants a copy. The program features dynamic screen displays of the parameter stack, the return stack and the last 10 execution steps. It allows automatic or manual single stepping of a program, decompiling a program step by step, patching a program while it is executing, an escape feature that lets you type regular FORTH commands while you are debugging, and a bunch of other miscellaneous features. It does not interfere with the user's screen so graphics oriented programs can be debugged.

The debugger is about 47 screens long, and takes up about 8K of RAM. It has been tested using Patrick Mullarky's fig-FORTH, and val-FORTH, and probably just about every other version of fig-FORTH. He believes that most of it would run on any other computer that runs fig-FORTH, once the screen display code was ported over.

My friend is willing to give away a copy as share-ware to anyone who sends a stamped, self-addressed floppy mailer, and a blank 5 1/4 floppy to:

Nick Tamburri
10 Oakhill Avenue
Clinton, Massachusetts 01510

The returned floppy will contain the debugger, installation instructions, and documentation in the form of the unpublished ANALOG article. He doesn't have a modem so he can't post it on a bulletin board somewhere but once it's distributed, anyone is free to post it.

2496. Mydos 4.51 wanted!

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-04 03:08:45 UTC
From: clf3678@ultb.UUCP
Message-ID: <1204@ultb.UUCP>
Source record: 115650

Howdy all,

A little while ago, somebody posted both Mydos 4.51 and some sort of source code for it (A-65 assembler?). A friend of mine (actually Bob Puff) has been looking for both, but hasn't found em. Both Bob and I would greatly appreciate it if somebody could post it here in this newsgroup.

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale

I've come into a good sized quantity of both Atari 850 interfaces
and Avatex 1200 modems.

The interfaces are in like-new condition and fully tested by myself.
They come with the power supply, but no SIO or serial/parallel
cable. Selling them for the miniscule price of $45 each!

The modems are partially Hayes compatible (all the important commands),
also in like-new condition and tested by myself. The phone cable and
power supply comes with it. I'm selling these for $40.

If you are interested, leave mail here, on BitNet, on GEnie, or on
my BBS. If you leave mail here, I doubt I can reply to you (the
mail system here at RIT really bites it). On the others, I can reply
with no problems.

Please add $5 shipping to each item's price. I will ship them either
US Mail 1st Class, or UPS. I prefer you send a check or money order
before I ship them out.

I also have a SMALL amount of modem cables for the interfaces. The cost
is $8 plus $1 shipping.

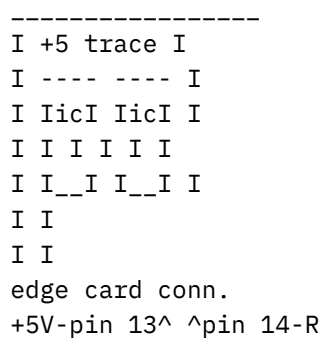
2499. Basic cart mod (switching it on/off w/o removal)

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-05 14:48:40 UTC
From: rfc@briar.philips.com
Message-ID: <63078@philabs.Philips.Com>
Source record: 115653

BASIC CART MODIFICATION
Installing a switch on the cart so Basic can be
switched on or off without removing the cart

I own an Atari 800 and about half the time use the Basic cartridge.
Other times I use programs that require that the Basic cartridge be
removed. This can cause a lot of wear and tear on the 800's
cartridge slot. To avoid this, the cart can be modified so it can be
switched in or out. I took apart my Basic cart, removing the shell.
I cut the circuit board trace connecting pins 13 and 14 on the
cartridge board (pin 14 is the source of memory map control signal
RD5). I installed a very small (approx. half inch long, and
quarter inch tall from the bottom of the switch body to top of
slider) slide switch (SPDT) on the top edge of the board, center
contact soldered to the +5V trace (the fat trace at the top IC side
of the board). The other contact is connected to pin 14. This
connection is made as far from the bottom edge of the board as
possible so it can be pluged into the 800's cart slot without
jamming. The metal housing of the switch should be connected to the
+5V trace to form a static drain (be sure it doesn't short to the
access door's metal shield; the metal shield could be removed if
necessary). The cart board is inserted with the chips facing to
the back of the 800.
When I want to use Basic, I open
the access door and set the switch to "B". When I need to remove
Basic, I turn the switch to "M", for machine code programs. This
causes the circuits in the Atari 800 to switch away from the cart
and to the RAM at the same addresses. The cart is effectively
removed. I rarely use other carts, but if I want to, I can still
unplug the modified Basic cart.

switch mounts on the top edge of the board



plug board into computer so that the ic's face

2500. Power sync on XL's

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-05 17:15:14 UTC
From: norlin@uokmax.UUCP
Message-ID: <3708@uokmax.UUCP>
Source record: 115654

Well, here's a completely new user of this net. Hope I don't screw up too bad.
Anyway, I just wanted to mention that the power supply on XL's IS, like the
XE's, D.C. Therefore, it seems reasonable to assume that it is not synchronized
with the power line.

I was just wanting to know, does anyone know if Antic Magazine is still around?
It was only at one library where I live, and then the library suddenly stopped
carrying it. I don't see it on any magazine racks. Is Antic alive?

2503. Using CC8

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-06 15:59:52 UTC
From: slackey@bbn.com
Message-ID: <45266@bbn.COM>
Source record: 115507

After using C quite a bit at work lately, I decided to try and use it on the 8bit. I wrote a triv program and after several attempts gave up trying to get it to compile under cc8. There is obviously something I'm missing.

Would some kind soul mind sending me a small example of some working cc8 code? Or better yet any docs on using cc8 and/or ace c? I have the notes that came out with the last release of cc8, but that's not too helpful for getting off the ground the first time.

There are other files on the disk which look like runtime libraries and stuff, which I assume I have to link in somehow. Because there's a file there called LINK.

Yes, I have a subscription. The library might have gotton mad when they
went to the more expensive disk-only format and stopped their subscription.

It is carried by my neighborhood Electronics boutique, although they have
dropped their Atari software line (ah, if only I'd bought more games
rather than program my own...)

Actually, it is CC8 that is missing something - that something is compatibility. I first learned C on a UNIX system, and later bought Turbo C. The migration from UNIX C to Turbo C was nearly effortless, but when I later tried a "Hello, world!" program under CC8, it took a LONG time to finally get it working. Little things like replacing '{'s with '$('s weren't too difficult, but the other incompatibilities are more painful. The real killer, however, is the SPEED. After using Turbo C, CC8 seems to take forever. Then there's the linking process, which is also very slow. I guess I'm just spoiled by the speed of Turbo C, but I find CC8 to be somewhat lacking as a development environment.

Stick with assembler; it'll be easier on your nerves!

I believe SynCalc, from Synapse, 17 Paul Drive, San Rafael, CA 94903-2101 is
still avaiable. It also has VisiCalc to SynCalc conversion. If you are
interested, I think it makes use of the extra memory in the 130XE.

2516. Was the program "Invasion" ever in Antic Magazine?

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-10 20:22:40 UTC
From: norlin@uokmax.UUCP
Message-ID: <3748@uokmax.UUCP>
Source record: 115520

In an earlier posting, I asked whether anyone knew if Antic was still around. Several kind persons told me that it most definitely was. Now that I know that Antic is still around, here's my real question. Did Antic ever publish a program called "Invasion?" It was a Star-Raiders type game in which the player moved a cursor using a joystick to blast alien ships coming out in 3-D. The interesting part of the program was the 3-D starfield that used a DLI on 192 lines with 8 different levels of star movement. I know all this, because I wrote the program. I submitted it to Antic over a year ago (last August), and it was accepted for publication. They said it would be published within one year, and I would get payment upon publication. Further, they said that IF they did NOT publish it within a year, I would get a kill fee of $60. As I mentioned, it's been over a year and I've heard nothing from them. I need to know whether I should just sit tight and wait for them to contact me, or if I should contact them, and, of course, if the program has yet been published. Oh, and yes, I did sign a contract; the contract, however, made no mention of the kill fee (that was in the cover letter they included).

Thanks in advance. I've been waiting for over a year and my nerves are getting frazzled!

2518. 256k related questions

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-11 00:39:55 UTC
From: wilmott@topaz.rutgers.edu
Message-ID: <Sep.10.20.39.53.1989.13502@topaz.rutgers.edu>
Source record: 115522

Hello fellow Atari enthusiasts! This past weekend, while attending a computer show, I came into a good deal. A stand was selling Atari 800xl's refurbished and in-the-box-with-everything for $35. I ended up saying "why not...I'll hold onto it as a backup in case mine happens to die on me". Once I got it home and did a little inspection of the unit, I discovered that not only did it look new and work great, but it has a 256k Rambo installed in it. This made my day since I've thought about having one installed in my old 800xl, but never did! 2 questions...

1) The video output quality. The 256k machine has a "softer" picture than my old 64k machine...the colors are not as vivid. Not that I think anything can be done about this, but out of curiousity; is the likely reason just that the new machine has a lower quality video circuit (it's a newer production run than my old one), or is the slight "washing-out" of colors a result of the greater power demand placed upon the transformer by the upgrade?

2) Software. Up 'til now, I've more or less ignored software designed to use memory beyond the 64k mark. Now that I've got some extra to play with, I'd like to know exactly which titles work only on 128k+ machines, or those that offer improved performance with more memory. I am interested in hearing about ANY type of software, from games to demo's to utilities to applications; whether they be commercial, shareware or PD.
Probably the thing I would like to find MOST is a word processor that takes advantage of extra memory and allows editing of larger documents. (up 'til now, Textwiz was my choice with about a 24k buffer...can I assume I can do better now?)

-Ray

I'm not too familiar with the 8bit ataris, but I need to
get a dump of memory with a particular program loaded. I found
someone with an atari and omnimon, but he doesn't remember how
to use it!!!

Could someone please send me a quick reminder on how to use
this thing?
(Again, all I want to do is load a particular program, then dump
all of memory to a disk file.)

Thanks in advance.

This "particular program" wouldn't happen to be M.U.L.E. by Electronic Arts,
would it?

Perhaps Jim Clark might be able to help you out... :-)

2521. Making an SX-212 work with Kermit-65

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-12 04:36:52 UTC
From: jean@maxwell.Concordia.CA
Message-ID: <1205@clyde.Concordia.CA>
Source record: 115525

After hours of effort in trying to make Kermit-65 work with my SX-212, I've finally discovered something that might be the culprit. It appears that the SX.COM handler (written by James C. Dillow) is the real problem, as it does not appear to emulate an 850 handler enough.

The thing is that the Kermit-65 code checks DVSTAT (746) and if it's not zero, there's an error. The 850 handler apparently uses each bit in DVSTAT as an error indicator. However, the SX.COM handler doesn't do that at all. It seems to use DVSTAT as some kind of counter for the number of bytes left in the input buffer, just like DVSTAT+1, except different.

The end effect of this is that I haven't been able to use Kermit-65 because it thinks the modem is spitting out errors, so what it does is zero out the input buffer counter, so I don't see received data most of the time!

I see three solutions here. 1) Get a better SX-212 handler.
2) Rewrite parts of SX.COM (yech)
3) Rewrite parts of Kermit-65

Solution #1 is the best one so if any of you have or know of an SX-212 handler that works with Kermit-65, please UUencode and post or mail it. Solution #2 would be difficult at best. Solution #3 is possible, as I am in the process of adding an XEP-80 handler to Kermit-65, meaning that I already have to make changes to it, but if I redo the modem interface part of it for the SX.COM handler, then it won't work with the 850, and that's no good.

Hello all!

I've received both some orders and some questions about the stuff for sale. Let me clarify this here, because the mail facilities here at RIT ROT IN HELL, and I can't send out e-mail properly.

To reiterate: The 850 interfaces are $45, modems are $40, $5 shipping per item.

If you would like to order one or both of these items, do the following:

1) Write out a small note telling me what you would like to order, where I should send it, and where you saw the ad for the stuff, to:

Chris Freemesser
223 Renouf Drive
Rochester, NY 14624

My phone number is (716)328-1703, so you can call me if you wish to, or you can call my BBS (number in signature). Also, if you have access, leave me a note on Bitnet or GEnie *INSTEAD* of E-mail here. I have no problems replying on these networks, only on UseNet.

I will send out the stuff when I receive payment (check or money order).

2) To those who have already sent payment: There will be a short delay in receiving the interfaces. The shipment of power supplies for them has been delayed by about 10 days. DO NOT FEAR! I will send these items out ASAP. I have the modems, so they get sent out immediately.

Chris Freemesser, Rochester Institute of Technology | What I like :
BITNET: %clf3678@RITVAX GEnie: C.FREEMESSER | 1) My Atari ST
USENET: Just reply and hope it gets through | 2) My '77 Mercury

You should not see any video difference between your XL and your XL with an upgrade, at least not from the upgrade. The only real way to check is pull the upgrade, but as a long time owner of a 256K upgrade and installer of many others, it's never been a problem.

Some packages that support the upgrade are:

Anything that runs on a 130XE, (ignoring a backpage video demo from Antic) as a 128K machine:

A large selection of ramdisk software

Typesetter 256, a PD bitmap typesetter
Paperclip 2.0. It would give 128K as an editing buffer, and when you used the spell checker, it copies the dictionary into the other 128K so subsequent checks are fast.
Various disk copy routines. I can't remember which off the top of my head.
The new MTOS, I believe, is supposed to support extended memory pages.

There are various other titles that will suprise you when they suddenly have more memory than you remembered.

For exploring your extended memory upgrade (or making one,) my Detroit BBS, The Club II, has an archive of all the extended memory software I've ever seen, much of it with source code. Some of it is very old software, like BASIC code just to switch banks to see if they're there, but it allows you to "follow" the progress of extended memory Atari history.
The Club II is at 313-334-8877 (and obviously has a lot of other 8bit stuff.)

Go with #1!

If you have a copy of the Express 850 modified for the SX212, which
I got when I bought my SX212, you can simply copy the file
SX212A.HI
over to you Kermit disk, and then append your KERMITNR.COM file to it.
If you need a copy of this file, get in touch with me..it's very short,
and I have been using KERMIT.COM with it for a long time now...

2527. Atari terminal emulator

My son recently got an Atari 800, 1050 disk, 850, and a hayes 2400 baud modem.
He wants to download some files from places like compuserve using
Ymodem, Xmodem, Kermit, etc. He has a small terminal emulator that will
allow him to save a ASCII data stream to disk. Does anybody have a terminal
emulator source, either basic or assembler, which has a protocol so that
he can bootstrap himself?
I could re-implement one but I much prefer to not re-invent the wheel.

Please mail to athey@lll-lcc.llnl.gov your responses. Thanks.

Sure you can! This game is VERY beatable! All's that you have to do is catch
enough ghosts to be able to pay back your debt..anything you make after that
is yours to keep until the next game..that's when you can use that cash towards
a better car/tools/weapons..
But, it is tough to beat the game and pass the Marshmellow man and get to the
last screen, but if you do then you can use your account towards the next game.
Enjoy...

If you earn a certain amount of money, something like 10000 or 100000
(I haven't played the game in weeks), you get a bankacount.
In the next game you play, you can use this money to buy better
tools, cars, etc.
I hope that you know that the main goal of game is not to catch as
many ghosts a possible, but to defeat Zuul.

The pins which are treated as rs232 pins are the I/O port pins...
The 'R' device is mainly non-exsistent unless you have bought a RS232
Interface, such as PR: Connect or the older Atari 850. But, you can
program the R: Device to control things such as a Direct-Connect modem...
the SX212 is such a modem, and I am using it right now without an RS232
Interface (Well, I would be if I was using my Atari right now, but I'm using
my Commodore 128 with it's interface to the SX212). Well, anyway, it's
just a convenient way for the atari to address RS232 peripherals..

(from the SX212 Manual)
RS232 Port

1 - Ground 2 - Transmitted Data 3 - Received Data 4 - Request to Send
5 - Clear to Send 6 - Data Set Ready 7 - Signal Ground 8 - Carrie Detect

2534. Help with Ghostbusters

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-18 16:28:28 UTC
From: norlin@uokmax.UUCP
Message-ID: <3804@uokmax.UUCP>
Source record: 115538

Ghostbusters is VERY easy to beat. Our bank account is now in the $900,000 range.

First thing you've got to know is all that extra equipment is NOT needed. All you need are two traps, ghost bait, and the cheapest car. Then, there are many ways to catch the ghosts, but the most reliable is the "smash the suckers against the wall" technique. To do this, position your first man at the VERY right of the screen. Press FIRE to make him drop the trap. Then, move your man to about 1/4 of the way from the LEFT of the screen and press FIRE to make him take position. Screen should look as follows:

GHOST (anywhere)

MAN #1 TRAP

Then, move in man #2 to the left of man #1; it doesn't matter which way he faces; he is unimportant.

WAIT until the ghost is well to the right of man #1; then, press FIRE. Screen should look as follows:

```
/
/
/
/ GHOST
/
/
/
/
MAN #1 TRAP
```

Then, edge the joystick right (DON'T rush it) so that the ghost eventually is sandwiched between the right-hand side of the screen and your beam. He's now stuck and can't move but vertically. Wait until he is low and right above the trap, then press FIRE, catching him quickly.

Now, since you only have two traps, head back to GHQ to "deposit" the ghost. If absolutely necessary, you can use the 2nd trap before heading back to GHQ.

Later on, you'll have more ghosts than you can handle. Eventually, the Marshmellow Man will come. You'll have about 3 seconds to react. You'll suddenly see all the ghosts converging on ONE spot on the map screen, and "---MARSHMELLOW ALERT---" will scroll on the bottom of the screen. Now, QUICKLY, press the "B" key to drop your bait. Then, the ghosts will all head to the BAIT instead of the point where they were converging. This averts the marshmellow attack and gives you $2000 (I think). If you fail and DON'T

avert the marshmellow attack, you lose $5000 (I think, but I KNOW it's more than you gain if you averted the attack). Anyway, enough of those $2000 bonuses, and your bank balance will be ABOVE its initial balance. And whenever the game ends with your bank balance ABOVE the initial balance, you get a new account number. Now, you see the reason for NOT buying all those fancy gizmos and the fast sports car; if you spend more money, you still MUST, I repeat, MUST *make* more money; the game is pointless UNLESS your ending balance is above your starting balance. As I said, this tactic got us $900,000. But, you see, that money is quite useless, since the more you spend, the more you must earn.

Once you get an account, you get an account number that you will enter next time you play, and you will start with the money that you ended up with last time.

Sorry, but I have no hints for getting past the Marshmellow Man at the end. I had to modify the program to get past him; my manual dexterity was lacking. If you know how to do this, go to it. The way I did it was as follows: since I have an 800XL, the O.S. can be put in RAM. I did this, then wrote a little NMI to take care of getting me past the Marshmellow Man. This NMI technique is quite versatile and generally applicable; if I'm lucky (and Antic ever publishes my game program "Invasion" that they said they would [see an earlier posting to learn more about "Invasion"]), I might be able to sell this technique to Antic, and you'll be able to get all the details there.

Just a sec, let me check the copyright stuff....
Well, it says that the 850 Express is Freeware...so if I tell you all this techinical stuff, I guess I can call you all my friends and post all the stuff!
The Author is Keith Ledbetter, and if you enjoy the 850 EXPRESS, feel obliged to send him anywhere from $5-$20...I guess his address is on the starting screen...
in addition to all that I will post a version of the SX212handler w/ Kermit which works...I'd know, I'm using it right now.

I'd do all this right now, but my Unix system isn't letting me Xmodem or Kermit anything right now...does anyone know where I can find source code for the xmodem protocol for the Atari and/or for Unix systems? With this help I can then post all those files.
I'll be looking for alternate ways, meantime.

BTW, I plan to ARC the whole disk, then dump it all, UUENcode it, and then post it...so, let me know if you need anything to help you undo it!

See you in a couple of days!

Marc Bluefire

Hi Marc,
There is a source file written in Action! (c) available from the 8 bit archives. The file name is: "XMODEM ACT". I can access the Bitnet archive on TCSVM for you if you can't get the file yourself.

2537. HD caching with Sparta

Newsgroup: comp.sys.atari.8bit
Date: 1989-09-20 20:22:07 UTC
From: a344@mindlink.UUCP
Message-ID: <519@mindlink.UUCP>
Source record: 115541

A friend of mine is running BBS Express! Pro (node 86) on a 130XE running SpartaDOS 3.2 with a 256K MIO and a 5 Meg HD (soon to be 20 Megs). I've noticed that SpartaDOS seems to make a lot of seeks to the HD, especially when writing files. Since Pro likes to keep everything well split up in lots of subdirectories, it's my guess that Sparta is following the directory chain around the disk every time a file is opened, especially if the filename specifies a path from the route (ie "D3:>PRO>DATA>FILE.DAT"). The net effect is that it can take upwards of 2 seconds to open a file, even though burst access is very fast once the file is open.

So, my question to all you Atarians is this: does anybody have a program to use the extended 64k of the XE to supply caching for the hard drive? I figure if the bitmap, directory and sector link sectors were kept in ram, and Sparta's read calls were intercepted so the sectors were supplied from ram instead of going to the disk, the speed could be increased by a huge amount, perhaps almost as fast as a ramdisk. Write operations would be done through the cash to the disk immediately; I think delayed writes is asking too much of the existing software.

If someone has a cache, or knows of someone that does, I'd really like to take a look at it. If not, I might attempt to write one in MAC/65, but I'd need better docs on the internals of Sparta and the MIO than I now have. This, too, would be much appreciated.

Thanks to all that reply.

From: kan@dg-rtp.dg.com
Message-ID: <1274@xyzzy.UUCP>
Source record: 115542

I used to have an Atari 800 with loads of wonderful games.
During one of the stupidest years of my life (freshman year in college),
I sold the whole kit and kiboodle for a song.

I miss the games; I want to write an Atari 800 (or 130XE) simulator in a
high level language, preferably C.

My hardware platform is likely to be my AT compatible with EGA graphics.
Another possibility is Unix with X Windows.

Has anyone tried/done this? If so, what level of success did you have?

Even if the speed of the simulation is unacceptable for games, I want to
do this for the challenge and experience.

I'd appreciate any pointers, and especially donations of unused Atari
reference manuals, particularly those on 6502 architecture, Atari architecture,
and the OS internals. Something like Mapping the Atari would be so useful,
but it's tough to find Atari books in the stores these days.

Thanks!

Victor Kan ***

Victor Kan asks about writing an Atari 8-bit computer emulator (simulator)..

The person to talk to would be Darek Mihocka. He's written a highly successful 8-bit emulator that runs on the Atari ST. Unfortunately I don't think he reads the 8-bit newsgroup, but he's active on the ST newsgroup, as well as all of the major national information services.

I'm afraid I don't know his e-mail address on UseNet, but I'm sure a message in the ST newsgroup will catch his attention...

Heeft iemand al enige ervaring met de nieuwe ATARI PORTOLIO computer?
Aangezien mijn AMSTRAD portable PC toch vrij heavy is voor het
dartelen over de velden, en ik telkens meer gewicht meedraag en ruimte
wil maken in mijn ransel voor het meesjouwen van mijn video-recorder,
wil ik in ruimte en gewicht bezuinigen op het formaat van de pc.
MAAR: is het transport van teksten naar PC en vice versa volkomen
eenvoudig en zonder problemen? Is er een reeks van onnozel dure
randapparaten en stekkers nodig om de normaalste dingen te doen?
Zijn de bijzondere tekens, de umlauten, trema's etcetera hetzelfde
als ze overgezonden zijn naar een PC? (bijvoorbeeld de Tandy 200
die mijn maat gebruikt, maakt worst van mijn trema's en mijn PC
maakt soep van de zijne).
Any news welcome. de middenstand hier is wel willing to sell, maar de
hardware hebben ze nog niet, en de kennis evenmin.
Groeten!

Does anyone out there have Diamond OS and is it worth the 70 bucks?

Merging pictures:
Use some sort of utility to "print" the picture, but direct the printed
output to a disk file instead of the printer. Then add the printed picture
into the atariwriter file at the appropriate place (after you have "printed"
the atariwriter file to a disk file also of course). Then you need to add
the specific code for your printer to turn off the graphics mode. You add
this code immediately at the end of the picture before any of your own text.

B/Graph:
Beats me.

Diamond:
Well, I played with it (a friend has it) and though I didn't really
like it, anyone who uses (and likes) a menu driven dos will probably like
it.

Yes, I am here on Usenet.

Victor (and all others interested),

The ST Xformer is an Atari 800/800XL/130XE emulator that has been in the
public domain for 2 years now. I recently released the 130XE emulator
into the public domain, and it is up on services like Compuserve, GEnie,
Delphi, and most Atari bulletin boards. Due to the huge size of the ARCed
files, I am not going to attempt to upload it here. The full ST Xformer
package fills up an 800K disk, and I have uploaded several more megabytes
of Xformer-ready 8-bit software to those same services.

For the last year, ST Xformer was a shareware program, and for a $20
donation I would send the user the latest version of the software, and a
user's manual, and provide almost free updates (and there have been many).
Also available, not from me, is the ST Xformer Cable, which allows almost
any 8-bit disk drive and printer to connect directly to the ST, so that 8-bit
disks can be used on the ST. The Xformer cable is available from dealers,
BEST Electronics, BRE software, or directly from Innovative Concepts,
31172 Shawn Drive, Warren Michigan for about $20. Call them at (313)-293-0730.

A few weeks ago I decided to the end the Xformer shareware offer. The software
is not in the public domain, as well as source code, and anyone who still
wants to get the user's manual, pinouts for the cable (to build your own),
or software on a disk, can get it from me for $10, although feel free to
send $20 if you want <grin>.

My mailing address is:
Box 2624, Station B
Kitchener, Ontario
N2H 6N2
Canada

My phone number (evenings) is (206)-883-6770 (for the next few weeks).

The reason I decided to "drop" the Xformer is because I cannot in all honesty encourage any 8-bit user to waste their money on the Atari ST. The machine was good once, but by today's standards it is a bottom of the line toy. To make matters worse, Atari has been screwing the users with their lack of support, constant vaporware announcements, and inability to actually ship a new machine after 2 years of promises.

So it's up to you. I have tons of ST Xformer disks and manuals still left, but if you do not yet own an ST, DO NOT BUY IT!!!! For the same price, you can get a very good PC or AT compatible computer. That is where the future is. Heck, get a Mac. Anything but an Atari. The Tramiels have ripped off enough people as it is already.

Finally, to comment on Victor's idea to emulate the Atari 8-bit on an Intel processor, go for it! The 8088 family is better suited for emulating a 6502 than a 68000, and a 286 or 386 would allow you to emulate it in real time. The biggest problems would be with the wide variety of screen cards on the PCs. You'd have to pick a graphics mode that most cards can support, while not going to the lowest 320x200 4 color mode. Also, sound would be a problem, since most PCs only have the one built in speaker. You can find the source code for ST Xformer on most boards, and if not, write to me and I can send it to you.

After 9 years of owning an Atari 400, an 800XL, several 130XEs, and several STs, and watching the company go downhill because of bad management, I've had enough. I will continue to support my other ST products, since people using those would already have STs anyway, and I want to support other users.

I currently have several operating 800's and 400's with several drives. I have most of the books which were produced for the 800 during its life.

I will compile a list and send via email or US Snail if you are interested, prices will be very low and some I'll donate. You pay postage on all you are interested in receiving.

Quick list:

ALL of Compute Atari Books
(Mapping the Atari, Atari Source Book, Inside Atari DOS, etc.)

Two sets of complete Atari 400/800 Tech. Ref. Notes with:
OS User's Manual
OS Source Listing
Hardware Manual

De Re Atari and other Chris Crawford stuff

Most of SoftSide and Compute (Atari) magazine issues.

Also have everything PD for the Atari up through about 1985 on disk. Got into Mac at that time and still use that and Atari ST about equally now.

Worse comes to worse and you need to contact me outside the net:

From: ken@hpclkms.HP.COM
Message-ID: <1270020@hpclkms.HP.COM>
Source record: 115554

I have made several modifications to my 600XL and 800XL, and I was
contemplating posting instructions on how to do the mods to USENET. The
mods that I have done are:
1. COLD-RESET button on the XL (and presumably the XE, though I haven't
tried it.)
2. Video monitor jack on the 600XL (includes composite video, composite
luminance, and audio, but no composite chrominance. However, on
my monitor, I have seperate chrominance and luminance inputs, and I
run the composite video output into the composite chrominance input
with out any problems.)
3. Simple 64K upgrade for 600XL. (Requires 2 RAM chips, and 3 wires.)

If anyone is interested in these mods, send me mail, and if there is
sufficient interest, I will post instructions to the net.

From: wilmott@topaz.rutgers.edu
Message-ID: <Sep.26.22.58.07.1989.28198@topaz.rutgers.edu>
Source record: 115457

Back in July I heard about a program to view ST Degas picture files on the Atari 8-bit. 2 weeks ago I got a copy of APAC and ILBMREAD, which allow you to view and convert Amiga IFF and HAM format picture files to full color, 8-bit-viewable pictures (and I must say I was rather impressed. The "zoom-in" feature is particularly nice). And so, as I sat at work today noticing my folder full of pictures on my Mac, I wondered.....
Does anyone know of a program out there that allows the viewing of Mac format picture files on the 8-bit? (specifically TIFF and/or RIFF format pictures; though Paint format would be better than nothing)

Any info much appreciated...

Ray:
A MAC picture viewer does exist; I found it on GEnie's Atari
8-bit library. It is written in compiled turbo basic, and only works
on uncompressed MAC pictures of a certain format.
I am the author of ILBMREAD (thanks for your comments). If you
could locate the format description of the MAC TIFF, RIFF, or Paint
files, I would make an attempt at a picture viewer.

This is getting rediculous. (sp?) First antic essentially forces people to pay for a disk subscription, then they go bimonthly. I guess the next step in a couple of months is no Antic at all. HMMF. I guess it's just another sign of somthing that we knew already. The Atari 8-bit machines are on their way to extinction. Do you think Im over reacting, or is this the way it's going to be?

Bill Marrs writes...

>buy a new computer....you'll feel so much better.

That's okay Bill...my wallet will feel much better if I don't. I came REAL close to upgrading a little over a year ago, when it occured to me - my Atari 8-bit still does what I need it to. Telecommunications? Works great. Bobterm (and Express) are easier to use than ANY term program I have yet seen on ANY other machine. Word Processing? Good enough for *occasional* use (ie-a term paper now and then, or maybe a letter). Games? Not too many new ones, but there are a few, and there's more older games than I'm likely to *ever* master. And that about sums up *my* personal needs. Sure, I am humbled when I see the power of the IIcx I use at work, or the great new game my friend just got on his ST. But I ask myself...is it worth shelling out $1000-$5000 for new hardware, PLUS hundreds or thousands more for the basic software packages that I'll want/need for the machine, just for some fancy graphics and improved speed? (Plus have to learn all the little tricks/secrets/idiosyncracies of yet another machine). In my book, NO! At least not yet...I'll stick to my 8-bit for my own home use for another year or two, thank you!

I think we both have very personal needs.

>...is it worth shelling out $1000-$5000 for new hardware, PLUS hundreds
>or thousands more for the basic software packages that I'll want/need
>for the machine, just for some fancy graphics and improved speed?

I think so. Those 'fancy graphics' include things like
photographic quality pictures, real-time animation, direct video input
editing, etc...
As for the improved speed, The difference in running a
mandelbrot generating program on an atari-8bit versus a Mac II is
measured like: Atari 8-bit: 3 days, Mac II: 3 minutes. Seriously, I
used a public domain Mandelbrot generator on a Mac II that used 256
colors and 640x480 pixels and it took under 5 minutes to draw the same
region and iterations as it took my atari 800xl to do in 3 days with
4 colors and 192x159 pixels. (I realize this can somewhat to using
basic on the atari, but still...)

>...I'll stick to my 8-bit for my own home use for another year or
>two, thank you!

Have fun, I would rather use my school's computers, they are
faster and easier to use. I used to bring my 800xl up to school so
that I could play games on it, but now I am play on others computers
and leave my 800xl in the closet.

Anyone out there interested in making me an offer for a 800xl
with 1050 disk drive P:R:connection interface, small thermal printer,
and 100's of games...It has to be worth my while to go to the trouble
of going home and getting it out of my closet.

Subject: Re: Antic

It seems that Antic has lost their minds. But reality is beginning to set in: you just can't make a profit on an Atari 8-bit specific magazine anymore. Look at the way Analog is combining Analog and STlog again. How about the fact that Atari Explorer is about 70% ST specific. Things just aren't looking brig ht even though we have an 8-bitter capable of displaying ST screens. Just hang in there, we've all just got to work together at keeping up the support!

I heard a rumor about one a year and a half ago but that was about it.
I even thought of writing one, really, the Amiga's roots are the Atari 800
not the C64 (bleck!! and thank God!). PM Graphics are in the Amiga as
hardware sprites, 4 channel sound, and display list interrupts (read
Copper List), and vertical blanks. If the two machine had been produced by
the same company, growth/upgrade path couldn't have been more logical. If
anyone does come acros one, let me know, I'd love to play Star Raiders again.

>3 minutes on a MacII.....3 days on an 8-bit

I *fully* agree. There are many things that are just impossible or ridiculous to do an the Atari 8-bit. Drawing a full-color Mandelbrot set. Doing desktop publishing (beyond a *real* simple newsletter). Heavy duty word processing. Real C programming. Hi-res picture scanning. You'll get *no* argument from me on such things. Then again, I said I'll keep my Atari for *my* *personal* needs. It's *more* than adequate for typing up a simple letter. It works fine for *simple* spreadsheet needs. It plays *thousands* of games. And in the area of telecommunications (which is about 75% of my needs), I *DEFY* you to show me an easier to use program than BobTerm. [I've seen friends' IBMs in action. I've seen friends' St's in action. I use Mac term programs regularly at work. *NONE* are as straight-forward and *easy* to use as BobTerm on my 8-bit. NOW IF ONLY SOMEONE WOULD MAKE AN 80 COLUMN (VIA SOFTWARE!) MODULE FOR IT!!!]

If you *NEED* the "fancy graphics" and faster speed of a 16-bit, why are you reading this????? UPGRADE! If you don't NEED it, why spend thousands of dollars?

And if you are so against Atari 8-bits, why are you reading this net?!?

In a recent posting, someone mentioned using their 8-bit for telecommunications,and expressed an ardent wish for an eighty-column, software-driven display module. I too would like to have an eighty-column communications program that works with an SX212 modem. Does anyone know of such an animal?

I must also profess my ignorance in regard to "Bobterm." I assume it is a communications package of some sort, but I've never come across it. (The nice men in the white coats don't let us out too often. :-))

Can anyone enlighten me on either of these points?

I think that you hit the nail smack-dab on the head, Ray. This discussion of obsolesence is ridiculous. Yes, we 8-bitters know that our machines are outdated, but we never said that they are the best computer in the world now or that they meet everyone's needs. For those who don't like using their 8-bits or are ashamed of owning them or have them in the closet, WHY ARE YOU READING A NEWSGROUP DEVOTED TO ATARI 8-BIT COMPUTERS????? Geez, doesn't that make sense?

Somebody was just asking about what Bobterm is. It is a public domain telecommications program by Bob Puff, the same guy who wrote ARC, DiskComm, MyDOS 4.5, and other 8-bit disk utilities. For an 8-bit terminal program it's quite powerful, supporting all baud rates up to 19.2 kilobaud. And it can still scroll the screen at that speed! It has the usual set of features like macros, type ahead buffer, xmodem/ymodem/quickb protocols, disk operations, and a capture buffer. I don't know if it supports 80 columns. Probably not. You should contact Bob either on Compuserve or GEnie, or call him at the ACORN BBS in Rochester, NY.

2575. YAU.COM, KERMIT 65 questions

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-03 15:04:51 UTC
From: den@hpfinote.HP.COM
Message-ID: <19810003@hpfinote.HP.COM>
Source record: 115479

Before I get into the details, let me list the system I'm using: 800XL with Claus Buccholz 256K ramdisk, Atari DOS 2 (modified so the duplicate disk command copies the boot sectors), Indus GT floppy, Atari 1030 modem.

First, I have some questions about YAU.COM. I have downloaded the Kermit 65 files that were posted a while ago with Bobterm 1.10 and Xmodem. I have noticed that this results in extra characters after the "end" statement. When I use YAU.COM to uudecode the resulting file, the byte counts are too high. This didn't really bother me but none of the kermit programs worked (KERMITNR.COM, KERMIT.COM, or KERMITSX.COM). If I use the basic uudecode, YAU.BAS, the files are smaller (YAU.BAS does not display a byte count or checksum) and KERMIT.COM runs. I can use YAUE.COM and YAU.COM to uuencode and uudecode these files after uudecoding them with YAU.BAS and the byte counts are OK. The checksums don't match but tha's probably because I changed the end-of-line character from a decimal 10 (line feed) to a decimal 155 (Atari EOL). I tried uudecoding the files before downloading them but that didn't work. Has anyone else seen these problems with YAU.COM?

Second, I have some questions about Kermit 65. After using the above procedure, I have gotten KERMIT.COM to run. It doesn't work with my 1030 modem, but it does give me a command prompt and do something. I have tried various R: handlers for the 1030 and run KERMITNR.COM with no luck. I have tried using SMARTT.COM, XM.COM (from Bobterm 1.10 which works with the 1030), and the R: handler that came with the modem. I have renamed the appropriate handler to AUTORUN.SYS and rebooted the system. Then I binary loaded KERMITNR.COM and the system hangs after loading it. No prompts or error messages, nothing. Is anyone else using Kermit 65 with the 1030 modem? If so, how did you get it running?

Yeah, the Amiga was created by the same design team who produced the original
Atari 800, and it's associating chips (Antic, Pokey, etc.). Also, the ST
was produced by the same guys who did the C-64 (Tramiel brought them over.).

The reason the old 800 guys left Atari, was because of Warner's mismanagement,
and we know that story...

2578. A65 problems

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-04 14:48:43 UTC
From: den@hpfinote.HP.COM
Message-ID: <19810004@hpfinote.HP.COM>
Source record: 115482

Has anyone else had trouble with the A65 assembler posted a while ago? I downloaded it last night and tried it without success. The byte count of 4732 was OK but it just locks up on my 800XL with DOS 2.0. I even tried loading the translator disk with no improvement. Any ideas?

If this doesn't work, does anyone know if the standard Atari assembler will work to generate Mydos? This is really why I am trying to get A65 running.

I haven't tried it, but I do have a copy. Did you get the message about making sure you can have (is it 4?) files open in order to save the listing to disk?

> If this doesn't work, does anyone know if the standard Atari assembler will
>work to generate Mydos? This is really why I am trying to get A65 running.

AMAC (the disk-based Atari assembler) works. That's how I assembled MYDOS for my system.

MYDOS is the fourth OS I have used on my system, and it is the one I'm using now (well not right now, right now I'm using a Sun). The reasons follow:

At first I used 2.5. Really ran out of gas when my XF551 showed up.

I used SpartaDOS for a while. AMAC won't run under it, though. I lost some work once due to what seemed like not great handling of error conditions. Likely more my fault that SpartaDOS, but you know.

Next DOSXE came out. I had a loving relationship with it, except that AMAC wouldn't run under it; I think it was because as the AMAC disk is copy protected, I couldn't copy it to a DOSXE format disk. So I had to load in the 2.5 translator, which took up too much space. Disclaimer: I am only guessing.

In fact, I had so much good luck with DOSXE that I didn't seem to need to keep backups. Well, as you can guess, the fateful day finally arrived. I got a copy of ARC, which I attempted to run under DOSXE. It was really my fault, I'm sure, because I did give it invalid input. I know instruction manuals are boring, and not at all in the true spirit of hacking. But the first 256 sectors somehow got blown away, and guess where the root directory is. Well I ended up plowing through the description of the file formats, wrote some hack programs, and surprisingly enough was able to reclaim most of the disk.

That pretty much did it for DOSXE, even though I'm sure its just an ARC compatibility problem. I don't know if ARC actually works under it; I never got around to trying.

Then, someone sent me a copy of UTIL.COM, the IBM PC program that writes MYDOS-compatible disks. I started bringing files home from the net now. To my great joy, I discovered that SpartaDOS could translate them to 2.5.

Finally, MYDOS showed up. Complete with sources. And AMAC runs under it! With one slight problem; I use the XF551 as drive 1, which switches to SSSD when the $%^& copy protected AMAC is loaded. Then it stays SSSD even when the disk is changed. I have been looking over the sources to try and find a fix. There are several I am contemplating, even the ability to have a logical name translation capability so that ^$%& copy protected disks can be loaded from drive 2.

Other stuff I am trying out is to put command line or desktop style into it, and move it under the ROM. I'm trying to decide which is better; DUP under the ROM, or ramdisk. (I have a ramdisk program that uses the 12K or so under the ROM. Was made for 64K machines. Only works with 2.5 though. This is the first ramdisk I have had; I had to modify my editor to coexist with it. I am trying to decide whether I should modify it to work with MYDOS, or just use the RAM as emacs-style buffers.

Anyway, yesterday I finally put the US doubler I have had for like 2 years into my 1050. I was told that it makes the 1050 DD, even when ultraspeed sector skew is not used. It does, including under MYDOS. Now finally I have 2 DD disks. I may sack the DS feature of the XF551, just so that disks can be interchanged.

Comments appreciated.

2583. IBM (gack) compatibility

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-06 13:09:06 UTC
From: rrwood@lotus.waterloo.edu
Message-ID: <16990@watdragon.waterloo.edu>
Source record: 115487

Someone recently mentioned that they could write Atari-compatible disks using an IBM? I'd heard rumours concerning this sort of thing, but I'd like to hear some specific information. Is it really possible? (well, all thinigs are possible) What sort of hardware/software is needed? Does it work both ways? (i.e., IBM->Atari and Atari->IBM)

Also, does anyone have an opinion about the 80-column version of AtariWriter? I'm finding it hard to live with a 40-column display, so AtariWriter is looking attractive....

R. Wood (rrwood@lotus.waterloo.edu)

2584. Kermit-65 with SX212

Take the copy protection out, i did it years ago it was easy and it allowed
my to use it on my dsdd percoms. I will try to figure out what i changed,
it was only a few bytes. Does anyone have a file compare program for the
atari?

>to load in the 2.5 translator, which took up too much space. Disclaimer:

Where can i get UTIL.COM? I have a friend with a 800XL who wants to read
the comp.sys.atari news, i have been collecting it to a file, and then
he downloads it 150K at a time. If i could write a disk from my machine
and give it to him that would be great. Could someone mail the program to
me?

2587. Re: get real

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-08 14:56:37 UTC
From: usenet@cps3xx.UUCP
Message-ID: <4904@cps3xx.UUCP>
Source record: 115491

Really now folks, any talk of "upgrading" your 8-bit is seriously out of line. The Atari 8bit's capabilities are unique, as is the software that came with it and the peripherals. Too often have I heard talk of "upgrading." It seems worthwhile to note that you don't "upgrade" as much as "crossgrade" in that you can get a new machine, like a shiny new Amiga 2000 with 4096-color mode and 4-channel DMAing digital sound, but you still wont have M.U.L.E., or instant-on peripherals, or modems with term software built in. Ever try and build a diskless terminal? The Atari 8-bit with it's built-in TV support and built-in no-disk-needed option on the 1030 is GREAT for travelling.

And these specifics aren't important. There will always be tons of programs that you have used and hardware options you have pu together on any quality machine that are more or less unreplacable. And 850 for instance - just try and find another machine with 4 serial ports. (5 if you add an R-verter) You can get it on an IBM clone easily enough, for a price.

My suggestion is to KEEP your 8-bit when you get a new machine. It wont get any slower, and you can always use a redundant computer. You get all of it's functionality and the new machines too, if you even bother to get a new machine.

You want "obsolete?" I'm logged on right now with a TRS-80 Model I, granted with triple-clock speed. It's been online as The Club BBS since 1980 - switched ON, running, with the world using it for over 75,000 hours. It still runs the board, and it's SITILL my primary word processor because, to date, no other computer supports the C-Itoh Prowriter in Proportional font mode properly! Likewise, no other computer has had binary/hex tools (like this term program I'm using, or disk editors) that came close. The machine serves a distinct purpose, as do the other TRS-80s, IBMs, Atari 8-bits and the Unix workstations that live here. (The Amiga is gone, sniff.)

You could, of course, try and duplicate all the functionality on any single machine, but it' would A) cost a fortune, B) be limited by the constraints of the machine architecture, C) be real tough for more than one person to use! and D) probably never be as functional.

Ever try and do 6502, Z80, 8088/86 and 680x0 development all on the same machine? Yeah right.

Several of the same machine is generally kind of handy too.

What one thing would I add if I could to this environment?
a
'386 Unix server, with a 16 port serial card and a good 300+
Meg drive that all the machines used as a centralizing
resource. (I thought about doing it with another 256K XL and
some 850's, but it's tough.)

Sigh. Come on folks, if Hungary can vote out COMMUNISM, we sure
as hell can cope with an integrated environment! Plan 9 will
save the day!

It is my understanding that the copyboard with copyIIpc can copy just about
anything. (including atari 8 bit stuff). It is basically a board that
goes inbetween the floppy controller and the floppy drive on the pc. I
assume it is just another type of controller. Anyway... it aparently
does work.

There is a file on GEnie in the 8-bit Atari Library (file #4595) called
PC_MYDOS.ARC. The description says "Use Atari SSDD diskettes on an
MSDOS". I have no other information, although I assume it is designed to
work with MyDos. I don't know if this is what you are looking for.
Hopefully, someone with additional information will add their comments.

Correct me if I'm wrong, but I seem to remember that AtariWriter80 is
designed to only work with the XEP80 80 column hardware adaptor. So, you
would have to make sure that you have a good monitor that will make 80
columns readable and spend the $80 for the adaptor. I believe I saw
an ad for a combo AtariWriter80/EXP80 in one of the ads in ANTIC. At least
it would be cheaper getting them at one time.

Never mind; I did this all by myself (almost) from a suggestion from someone
else. It was triv; I used a disassembler I got from ANTIC a few months
ago, and a little BASIC program to actually twiddle the bytes. It starts
up faster now, now that it doesn't do the extra disk access.

Note to any possible pirate dogs: No!

AMAC USERS READ THIS: It looks like some people don't know the fix
to AMAC's bug in putting a label on a macro. Just terminate each label
with a colon. That was what I tried when I first ran into the problem,
and have never had a problem since.

Now, for the request. Has anyone written a debugger that can be
assembled in with an AMAC source? I was thinking along the lines of
say pushing BREAK to interrupt out of the program to get to the
debugger, doing exam/dep, and returning to execution. Sure a
disassembler for single stepping, breakpoints, etc would be great.
OK, MAC/65 has this stuff, not to mention the assembler cartridge, but
AMAC still has its advantages. When I made my editor, I made up
a small one that I included that could examine only, but in that
environment it was easy.

From: wrd@tekigm2.MEN.TEK.COM
Message-ID: <6640@tekigm2.MEN.TEK.COM>
Source record: 115499

With the "Option board" from Central Point Software, along with the CopyIIPC software package you can copy most Atari disks using your PC (IBM or most compatibles). I have done this on my PC as I have the option board. Essentially the Option board is in series with the disk controller board and it makes your PC disk drive run like an Atari disk drive. (An Atari disk drive can do things that normally a PC disk drive cannot.) There are some exceptions to the copying of Atari disks. Some copy protection schemes do not copy and it will not copy the flippy side of a disk. Why I do not know, since normally an PC uses double sided drives and CopyIIPC copies bit by bit, but it will not copy backwards (which is essentially what it thinks the back of a flippy is). Software that it will not copy include SynFile, SynXX, etc.

Now, what I want, is some software to allow my Atari 1050 disk drive to read single sided IBM disks. I have a utility that someone sent me, but apparently it requires the use of either MYDOS or the US Doubler.

CopyIIPC and Option Board are copyrights/patents/trademarks of Central Point Software; SynFile, etc. are .... from Synapse Software, PC ... etc.

I have an 800xl that ocasionally I use a modem standard modem with. If you
solder a few junpers on the motherboard, you can use the joystick port.
(get a joystick cable and cut it, and put the rs232 on the other end).
Anyway... the problem with that method is that the joystick port is limited
to 300 baud. There are some other cabeling methods that I never got around
to trying that will allow a faster baud rate.

jim@jose.uucp

2598. What do you use them for.

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-12 20:41:38 UTC
From: rrwood@lotus.waterloo.edu
Message-ID: <17173@watdragon.waterloo.edu>

Just out of curiousity, what do you people use your Atari 8-bit machines for, anyway? Word-processing? Data communications? Games? Programming (and what sort of programming?)? Dynamical Systems Research? Divining the ultimate question of life, the universe, and everything?

Personally, I do a little bit of sloppy programming in Atari Basic or machine language (with the original Atari Assembler Editor). I've never tried Turbo Basic or any other Basic, and I've also never tried any other Assembler (though I have lusted a little after MAC/65).

As well, I'm trying to get set up with some sort of communications package that supports an 80 column display using software. I have a VT100 emulator but, unfortunately, I don't have a proper SX212 driver to go with it (the driver I have conflicts with the emulator software).

And finally, I'm looking for a decent 80 column word processor. As far as I know, two such animals are available (one from Atari and one from some company that advertises noisily in Antic), but I've yet to hear from anyone who actually uses either of them.

So, there you have it.

Somebody loaned me the Alien Voice Box II (no knobs) and two disks to go along with it (demo on one, applications and utililties on the other).
So far, when I boot up the demo disk (without holding OPTION down) on an 800XL, I get the main menu but no sound except for a low hum (two distinct tones) that sounds like the oscillators playing at their lowest audible level. I've tried it with the Translator (I don't know which one) and it does the same thing.

Oh yeah, the keys lock up too.

Am i doing something wrong, or is there something wrong with the Alien stuff?

I haven't tried SAM yet.

HOW TO ADD A MONITOR JACK TO A 600XL

THIS MOD IS COPYRIGHTED BY KEN SUMRALL. HOWEVER, YOU MAY FREELY
DISTRIBUTE IT, AND MODIFY IT, AS LONG AS THIS NOTICE IS INCLUDED
IN ITS ENTIRETY. THE AUTHOR MAY BE REACHED AT THE FOLLOWING
EMAIL ADDRESSES:
ken%hpda@hplabs.hp.com
...!hplabs!hpda!ken

Here are instructions on how to add a monitor jack to your 600XL. This jack
contains the following signals:

pin	signal
1	Composite luminance
2	Ground
3	Audio out
4	Composite video
5	Composite chrominance

The numbering convention for the DIN connector is:

```
3 o o 1
5 o o o 4
2
```

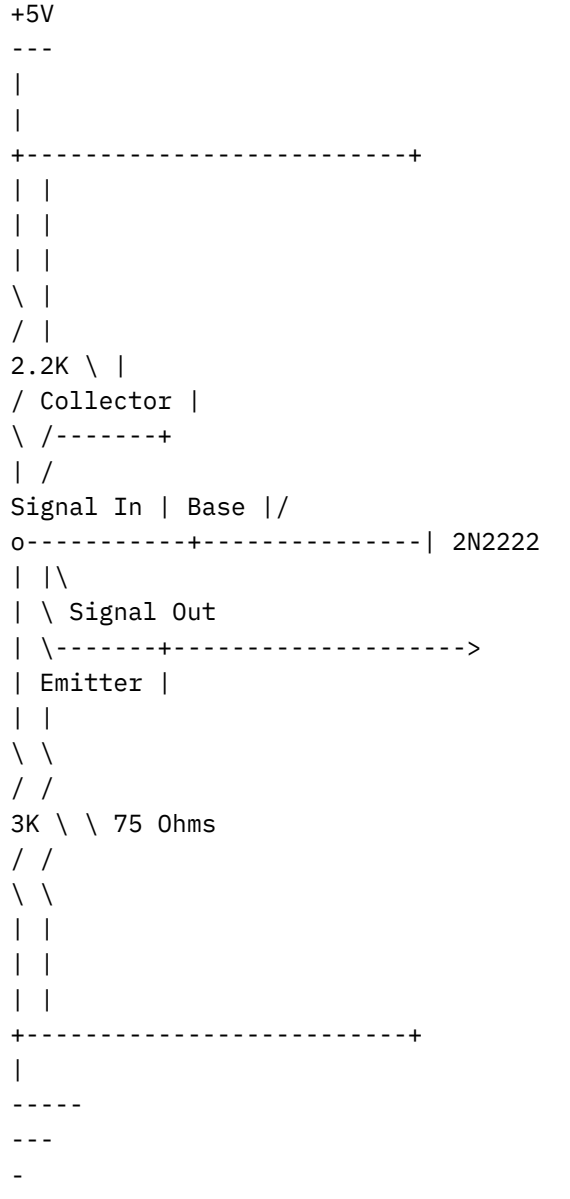
This mod for the 600XL provides every one of these signals except the
composite chrominance. (Actually, the 800 and the XE both supply
the composite chrominance signal, but the 800XL does not. Adding
the composite chrominance signal to an 800XL is a simple mod that
was described in ANTIC a few years ago. If you can't find the
mod, send me e-mail, and I will try and find it.)

COMPOSITE VIDEO (pin 4):
To add composite video to your 600XL, you need the following parts,

which are all available are Radio Shack:

(1) 2N2222 general purpose transistor
(1) 2.2K ohm resistor
(1) 3K ohm resistor
(1) 75 ohm resistor
(1) 5 pin DIN female connector

Here is the circuit diagram. It is a basic emitter follower circuit:



I built this by just soldering the resistors and the transistor together,
and did not put this on any kind of circuit board. After you have built
this little circuit, you unsolder the 1st wire from the right of the
RF modulator as you look at it from the front of the computer,
and then solder that to the Signal In of this circuit.
You then connect the Signal Out line to the 1st terminal from the right of the

RF modulator, and also connect it to pin 4 of the DIN connector. You should use shielded wire when you connect the Signal Out line to pin 4 of the DIN connector. You can connect the ground wire to any major ground point on the mother board. I hooked mine to the metal case of the RF modulator. The +5V line is also available on the RF modulator. The 2nd pin from the right of the RF modulator is the +5V power supply for the RF modulator.

COMPOSITE LUMINANCE OUTPUT (pin 1):
To add composite luminance (black and white signal only) to the DIN connector, connect a 75 ohm resistor between the emitter of transistor Q6 and pin 1 of the DIN connector. You should use shielded wire to keep noise from appearing on the line.

AUDIO OUTPUT (pin 3):
To add audio output to the DIN connector, connect a wire from the 2nd terminal from the left on the RF modulator to pin 3 on the DIN connector.

COMPOSITE CHROMINANCE (pin 5):
I have not found a simple mod to pick up the composite chrominance signal for the DIN connector. I have not looked terribly hard, however, since it is possible to use the composite video output as a composite chrominance signal on many monitors. That is how my 600XL is hooked up to my separate composite chrominance/luminance monitor, and it looks great!

GROUND (pin 2):
I just connected pin 2 of the DIN connector to the metal box that the RF modulator lives in. However, you should be able to hook this pin up to any major ground point on the motherboard.

I was able to mount the 5 pin DIN connector on the back of my 600XL, between the RF modulator and cartridge slot. It is a slightly tight fit, but you can fit it if you are careful.

HOW TO UPGRADE YOUR ATARI 600XL TO 64K RAM

THIS MOD IS COPYRIGHTED BY KEN SUMRALL. HOWEVER, YOU MAY FREELY DISTRIBUTE IT, AND MODIFY IT, AS LONG AS THIS NOTICE IS INCLUDED IN ITS ENTIRETY. THE AUTHOR MAY BE REACHED AT THE FOLLOWING EMAIL ADDRESSES:
ken%hpda@hplabs.hp.com
...!hplabs!hpda!ken

You will need the follow parts to perform this mod:
(2) 4464 RAM chip, 64Kx4, 150ns or faster.
Additionally, you will need chip pullers, a soldering iron, and 3 small pieces of wire. I used wire wrap wire when I did this mod.

If the chips on your 600XL are socketed, you're in luck, otherwise, you need to first unsolder the following chips:
(1) 74S32 location U18
(2) 74LS158 locations U5 and U6
(2) 4416 locations U11 and U12

and put sockets on the mother board in their place to make the job easier.

Now bend up pin 9 on the 74S32, and put it back in its socket on
the mother board. Bend up pin 3 on the 74LS158 in location U5, and put it
back in its socket. Also, bend up pin 10 on the 74LS158 in location U6,
and put that chip back into its socket. The last two chips you need to
change are the two RAM chips. Put the 4464 chips into the sockets at
locations U11 and U12 on the motherboard.

Now you need to install 3 wires to complete the mod. The first wire should
be connected between pin 3 of the 74LS158 at location U5, and pin 20
of the parallel bus on the 600XL. The second wire should be connected between
pin 10 of the 74LS158 at location U6, and pin 18 of the parallel bus.
The third wire connects between pin 9 of the 74S32 at location U18, and
pin 45 on the parallel bus. That's all there is to it.

HOW TO ADD A COLD BOOT SWITCH TO THE ATARI XL AND XE COMPUTERS

THIS MOD IS COPYRIGHTED BY KEN SUMRALL. HOWEVER, YOU MAY FREELY
DISTRIBUTE IT, AND MODIFY IT, AS LONG AS THIS NOTICE IS INCLUDED
IN ITS ENTIRETY. THE AUTHOR MAY BE REACHED AT THE FOLLOWING
EMAIL ADDRESSES:
ken%hpda@hplabs.hp.com
...!hplabs!hpda!ken

To add a cold reset switch to an Atari XL or XE computer, just connect
a normally open push button switch between pins 13 and 14 on the
cartridge slot. These pins are +5V and the cartridge present lines
respectively. Unfortunately, hooking up a switch to the CPU Reset line will
do no good, since the SYSTEM RESET switch on the XL is hooked up to that
line already, and it doesn't force a cold boot.

To use the reset switch, push and hold the SYSTEM RESET button already
built into your XL. Then, push and hold the new switch you installed.
Now let up on the SYSTEM RESET switch until the computer starts to boot.
As soon as the computer starts to boot, push and hold the SYSTEM RESET
key again. Now let up the the new switch you installed, lastly followed by
the SYSTEM RESET key. The computer will start to boot again. If you want
to boot without BASIC, you should hold down the OPTION key before you let
go of the SYSTEM RESET key for the last time. This may seem complicated,
but with a little practice, it becomes second nature. I mounted my cold
reset switch right above the SYSTEM RESET key on both my 600XL and 800XL,
and I can easily do this with one hand.

Here is a description of why this works. When you hit the SYSTEM RESET key
or turn on the XL or XE, the OS ROM performs a checksum of the cartridge area,
and if it doesn't match the last checksum it computed, assumes that someone
either inserted or removed a cartridge, and starts to do a cold boot
sequence, instead of a warm boot sequence. So when you hold down the
new switch, it pulls the cartridge present line to +5V, which forces the
hardware to disable the top 8K of RAM. Then, when the computer computes the
checksum of the top 8K of RAM, it computes that checksum of a non-existent

cartridge which should return random garbage, since no ROM is really present. Since the checksum won't match the previous one, this will make the OS want to perform a cold boot. You then force another cold boot when you let up on the cold boot switch and press the SYSTEM RESET key again, so that the computer won't boot assuming incorrectly that it has a cartridge inserted.

One obvious flaw in this design is that you can't force a cold boot if a cartridge is really inserted. However, the only cartridge I own is BASIC XE, and I can type "bye" to drop into the self test, and then hit SYSTEM RESET to cold boot the system from the self test.

2605. Re: Problem with MYDOS

Newsgroup: comp.sys.atari.8bit

>the system hangs. What's the fix? Guesses will be gratefully accepted.
>In lieu of that, I guess I'll have to figure it out myself. Might it
>have something to do with the relocation crockery?
>
>Thanks! -Stan

Stan, I experimented with different combinations of MyDos 4.51 and the XEP80 handler and here's what happened:

- Intalled the XEP80 driver as AUTORUN.SYS on a MyDos disk and booted with BASIC, and I did get into 80-column mode.
- Did the above but held down OPTION to disable BASIC. It did blank out the screen temporarily but then it went to the MyDOS menu (in 40-columns).
- When I type DOS from BASIC, I lose 80-columns and end up at the DOS menu in 40-columns, and I can't reenter 80-columns (handler disappears from HATABS).
- Booted from a disk with DOS.SYS and DUP.SYS only, and tried to load the handler from the menu. It blanked the screen but I didn't see any characters. It didn't lock up, though, because I could still hear my keystrokes, and I was still in the menu because when I hit 1 to get a directory, the drive started up.

Conclusion: DUP.SYS is the culprit. It seems to do a warmstart that modifies the handler table. It might also be playing with the display list pointers, as well as other display registers. This is only a guess, and seeing as I don't use MyDOS (or any other DOS that needs a DUP.SYS - blecch!), I can only suggest that you use DOS XL as I do, or reprogram MyDOS. Happy hacking.

This is a request to anyone who might have a program called Daisy Dot III (a text formatter for graphics printers). I recently tried out Daisy Dot II, but it didn't work too well with my Legend printer, which is Epson-compatible, except for graphics (at 1280 dots per line, instead of 960). What happens is that the text looks like it's a bit squished to the left, and it leaves the right part of the page empty.

I figure the newer version of the program has more printer drivers, and that it might also have more features, so if anyone has it, please upload it either here as a uuencoded ARC, or to the new ftp archives at 35.1.33.8 (terminator.cc.umich.edu).

While I'm at it I might add that some of the stuff at terminator could use some updating. There are newer versions of superarc/unarc, Textpro, and MyDos, unless I'm mistaken. And judging from some recent posts, some people might like to see some SX212 handlers and terminal programs too (myself included). I'll be taking care of uploading a new Kermit-65 once I finish updating it for XEP80 support, and perhaps Xmodem.

I might just add that there's a program called T:Edit (TEDIT.COM on terminator) which doesn't work (the file was cut short by someone), so don't bother downloading that unless it's been replace (the bad one is 6169 bytes long).

2607. CC65 released!

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-15 15:37:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19891015153740.4.JRD@MOA.SCRC.Symbolics.COM>
Source record: 115361

Date: 11 Oct 89 13:40:58 GMT
From: att!cbnewsc!wrw@ucbvax.Berkeley.EDU (wayne.r.wilcox)

What is CC65? Is it a new C compiler like CC8? Can you give a summary of its features?

CC65 is indeed a C compiler for Atari 8-bitters. It comes with an assortment of tools; an assembler (that generates relocatable object code, rather than fixed-address executables), a linker for linking object files and libraries into executables, an object file librarian, and some other random stuff.

The win (I think) of CC65 over the other freeware C compilers is that it generates real machine code, rather than p-code which must then be interpreted. Granted it's not great machine code, but it's still much easier to deal with than the totally opaque stuff that the other guys use. It's also trivial (well, not hard, anyway) to write assembly-language subroutines for it.

For more doc on CC65 and how to use it, see the ARC file of documentation in the Atari 8-bit program archives, in the cc65 subdir.

2608. Visicorp

Date: 14 Oct 89 04:42:21 GMT
From: m2c!wpi!jhallen@husc6.harvard.edu (Joseph H Allen)

And is it Yet-Another Smallc Derivative or is it a real compiler?

Yes, it is a member of the Small-C family, but it's had considerable
stuff added to it compared to most of them (structs, real
pointer-handling etc). As for whether it's 'real', well, it works, and
all the source is available. I think it's a win compared to the
ACE-C/CC8 frobs, as it's not an interpreter. Beyond, you'll have to
judge for yourself.

The only real PD compiler I've ever seen is GNU C. Unfortunately I doubt that
will be working on Atari 800s any time soon...

Right. Given that the executable's almost 10 times the address space of
a 6502...

>Thanks in advance - tippy!roger@newton.physics.purdue.edu

You can't do it. The 8-bit uses a color composite signal, while the
ST uses an RGB output. Ergo, they are incompatible with each other.
You might be able to do it by using the Monitor Master from Practical
Solutions, which will give you a composite output (I think), but I think
that even trying isn't worth it.

From: rrwood@lotus.waterloo.edu
Message-ID: <17311@watdragon.waterloo.edu>
Source record: 115370

I've been playing around with my modem (an SX212), trying to do some elementary communications stuff. Basically, the program I've written does the following:

1) open up the keyboard as device #1 (through the K: handler)
2) open the modem as device #2 (through the R: handler)
3) continually executes a loop which
i) checks to see if a key has been pressed, and if so, the keystroke is read from device #1, put to device #2, and printed on-screen.
ii) tries to read an incoming character from device #2, the modem, and if there is an incoming character, print it.

This sounds all well and good, but I can't read from the modem without getting an error. This occurs even when there are incoming characters available.

My question is: What am I screwing up? How do I poll the modem to see whether data is available, and then how should I read it? (single character get, or input a string?) What other stupid things am I doing?

Any and all advice appreciated, etc., etc., etc.

Stan, the address space between $D000 and $D7FF is always reserved for the device registers, and thus the RAM in that address space is unaccessable. Thus, you can only use 62K RAM in a '64K' 800XL, and 126K in a '128K' 130XE.

I might add that if you plan to use the 'hidden' RAM, don't forget that when you switch out the OS, the character set disappears with it, as do the interrupt routines. One way to handle this is to copy the ROM character set to the RAM beneath, and disable all interrupts using SEI, and POKE NMIEN ($D40E) with the necessary value (and the same for IRQEN - $D20E).

I don't have my manuals with me, but you need to do a status call to the
R: device & check a particular location. 746 rings a bell, but I'm not sure.
This location will hold the number of characters in the input buffer. You
will also need to set the R: device to concurrent mode. I believe an
XIO 40,#RDEV,0,0,"R:" should do it. There are other little details to mess
with like translation, parity, etc. too. You might want to consult a manual
somewhere. The original "Your Atari Computer" had some stuff on it in the
section on the XIO command. You might also want to look through any junk
that came with your modem (or interface, if you aren't using the direct-
connect facility.)

2620. MEDIT/AMAC under SpartaDOS

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-18 01:25:45 UTC
From: usenet@cps3xx.UUCP
Message-ID: <5023@cps3xx.UUCP>
Source record: 115374

Has anyone ever successfuly used AMAC and MEDIT under SpartaDOS?
SpartaDOS has a wonderful RAMdisk driver, RD.COM, and if you
haven't used the original Atari production macro assembler
before, let's just say it's VERY obvious Atari had hard disks
for the development group. Or depressants. Regardless, I bought
the AMAC/MEDIT macro assembler package but would like to use it
under Sparta and it chokes. It also assumes the default drive
is 1 and some other crimes. Certainly one could always use a
ramdisk driver for DOS XL or the like, but what a crime. SpartaDOS
is clearly the hot Atari DOS and now it looks like I have to
do some work in 8bit ville again so...

News would be appreciated.

In article <5023@cps3xx.UUCP> conklin@frith.UUCP (Terry Conklin) writes:
>Has anyone ever successfuly used AMAC and MEDIT under SpartaDOS?

I never got it to work, I suspect because AMAC can have far more than 7 files open at once, and I suspect in order to do this it ends up twiddling the I/O system at a lower level than regular software would, and SpartaDOS probably doesn't look the same as DOS2 in its lower levels. The behavior I saw was it would read the first file, but hung when accessing the first INCLUDE'd file.

AMAC does however run under MYDOS, which has tons of RAMdisk support. I use AMAC under MYDOS, with the text/program editor I wrote (under AMAC.)

The reason AMAC has its drive 1 fixation is for the &^*$% copy protection. This subject came up here a week or two ago.

>registers accessed in the same way as when ROM is on?
>Thanks. -Stan

If by "device registers" you are referring to what I call "hardware registers" located in memory beginning at $D000, then no, the device registers are NOT shut off. These memory locations have no RAM; thus, it is technically inaccurate, for instance, to say that the 800XL has 64K RAM; it actually has only 62K RAM. That means that when you shut off the OS to get to the RAM underneath, your extra 14K (not 16K) will have a nice big gap right in the middle of it.

As to your second question, yes, the device registers are accessed in the same way as when the ROM is on. Be aware, of course, that when the ROM is off, no system interrupts are processed, and stuff like changing the screen colors and such will be done directly through the hardware registers.

Now, I'm talking about the 800XL. I have little experience with the 130XE, but I believe its architecture is identical (except that the extra bits in the $D301 memory switch are used to control extra 16K banks, but the hardware register locations still have no RAM underneath, so I think the 130XE has only 126K RAM), so the information should be equally applicable to both the 800XL and the 130XE.

Hope this answers your question. Switching out the OS to get to the RAM underneath, though, is not usually worth the trouble.

I know there are a number of different Dos's around for the 8-bit Ataris.
What are their relative advantages/disadvantages?

I'm presently using Atari's Dos 2.5 an my 130XE with a single 1050 drive.
If anyone were to recommend a "better" choice, I'd be happy to listen.

First of all, if you are comfortable with the DOS you are using, there is little reason to switch. For the system you have, 2.5 has many advantages which include the price (free) and compatability with most software. One of the features most more advanced DOS's have is subdirectory support. Since you are limited to an enhanced density disk, there is little need to split up your files into directories.
If, however, you decide you want something else, the two most common (from my experience) are MyDOS and SpartaDOS. MyDOS retains the look and feel of the Atari DOS 2.X line while adding subdirectories, larger disk sizes, and most any size of RAMdisk. One problem I have had with MyDOS is the slightly modified sector count field in the directory listing; it uses 4 characters instead of 3. This throws off a few programs, but it isn't a major problem.
SpartaDOS replaces the DUP.SYS idea with a resident command line interface, resembling somewhat the MS-DOS interface. SpartaDOS also supports subdirectories, larger disk sizes, and RAMdisks. It also adds a number of other features which include a real time clock, keyboard buffer, time/date stamping of files, and all sorts of other stuff. SpartaDOS formatted disks are incompatable with Atari DOS 2.X disks due to a new, more efficient format scheme. However, the later versions of SpartaDOS (the earlier versions are rarely used) have no problem reading and writing DOS 2.0 disks. They will read 2.5 disks, but can't write to the extended sectors.
Personally, I use SpartaDOS X, the DOS on a cartridge. It has even more advanced features like ARC resident (sort of) all the time. In general, SpartaDOS is more powerful than MyDOS. However, MyDOS is now free, while SpartaDOS costs money. Any decision should depend on how much power you need and whether you are willing to pay for it. There are other DOS's, but I have not used them.

I'm doing a research paper on the apparent demise of the Atari
8-bit computers. Don't get me wrong, I love my Atari, and I'd die for
my 130XE, but I'd like to know all your opinions on the subject.
Did you use to own an 8-bit? What made you upgrade? What do you think
is in store for the future of 8-bits and STs? I know there are a wealth
of articles written on the subject (ANTIC, ANALOG, etc.), but
hearing from you would really help.
Responding to this note is OK, but email would be better.

Thank you.

2630. Re: XL/XE RAM

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-20 00:10:34 UTC
From: Ordania-DM@cup.portal.com
Message-ID: <23199@cup.portal.com>
Source record: 115384

Short lesson in memory management on the XL/XE computers:

Address Use
$c000-$cfff ROM
$D000-$D7ff device registers
$D800-$FFFF ROM

The device registers can never be disabled, they are physically wired such that any instruction referencing the area from $D000-$D7FF accesses them.
When you disable the ROM, you disable the entire thing and you can access the ram from $C000-$CFFF and $D800-$FFFF.
The best source of information for this is "Mapping the Atari" by Compute Books. Make sure you get the "Revised Edition" (it says that on the front cover).

2632. help with Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-20 16:07:00 UTC
From: WSR5672@TNTECH.BITNET
Message-ID: <8910210938.AA01173@ucbvax.Berkeley.EDU>
Source record: 115386

A friend of mine recently got a second hand (slightly modified) Atari 800.
I was wondering if there was any place that you could purchase/order the
manuals for it. I realize that it is a long shot, but I thought I would
give it a try.

My primary reason is to find out the pin configurations of the video
output and the serial port.

I want to connect it to my printer (C. Itoh 8510A), which has a Cardco G+
interface made for a Commodore 64.

Is there any place that I could buy cables which connect into the serial port?
I tried Radio Shack...
I show the disk drive cable to the salesman...
me : "Do you have any of these"
salesman : "I never SEEN anything like that before"

After using the Atari 800, I'm surprised it didn't become more popular than
it did. I like it, but it is a strange animal after using a Commodore 64 for
5+ years.

Any help would be greatly appreciated!!!

Yet another message from a die hard 8-bitter who claims he would die for
his machine. heh. He's doing a scientific paper on why the 8-bit has demised.
Well, how's this for an answer. It's old and uses out of date technology.

Let's poll a few of these die hard 8-bit users out there. Have you ever
bought a scientific calculator, even though you know that a simple 4 function
calculator can do anything a scientific can, given enough time. Have you ever
sold your old 2 head VCR and bought a 4 head stereo VCR. Or sold an old car
that ran just fine so that you could get a new 1989 model? Why is the
8-bit Atari any different? Yes, it may bring back warm and mushy memories
of the days of trying to figure out whether Maxell or BASF tape works better
with the cassette player, or trying to tune in your TV to get the best
picture in Atari BASIC, or using modems that interface to the joystick port.
But it is not exactly leading edge. Sure, I've heard 8-bitters tell me that
their computers work just fine and do everything they want them to, but usually
these people were too ignorant to be aware of the capabilities of other brands.
If you prefer to listen to a vacuum tube radio, that's your right. Don't go
out and buy yourself a brand new component stereo system, but on the other
hand, don't go around advocating that others should buy vacuum tube radios.
And don't go weeping about the demise of the vacuum tube. That is the nature
of technology. 5 or 10 years from now, we'll be looking back and laughing at
the 80486 chip as being old and out of date. So let nature take its course.
The 8-bit is dead. Forget about it. Bury it. Deep six it. Get out of the
70's and 80's and live for the 90's. I paid $900 for an Atari 400 in 1981.
That's about $1500-$2000 of today's money, for which you can now buy a
machine 100 times faster. If anything, I should be worrying about the demise
of that $900, not the silly beige box with the membrane keyboard.

I am an atari 800 XL user and would like to be able to use the several of the available term and file transfer programs that are available, especially kermit. Through ftp I have kermit-65 but it seems that I need a driver to run these programs, even though I have a direct connect XM301. From terminator's documents I thought that SMARTT would do the trick, but DOS 2.5 says that I "NEED MEM.SAV TO RUN THIS PROGRAM". When I create MEM.SAV, it goes through all the comotion and then returns me to DOS without having gained anything. I have no RS232 port or driver and have tried eveything to my knowledge to get it to work, but with no luck. Can anyone help me with this or recommend something. It will be greatly appreciated!

You would be hard pressed to call that posting "offensive," but I might call it less than totally accurate. We are lacking a definition of "dead" here. Without knowing the question, how can you possibly answer it?

There are a couple "kinds" of dead. And the 8-bit is not universally dead by all definitions.

The machine itself is certainly not dead. The machine runs, runs pretty well. I challenge any statement that says the 8-bit is out-of-date. The Atari 8-bit, designed in '78 or not, can still produce graphics beyond the capabilities of the current IBM standard, EGA. (It'd be VGA, but it's too steep.) With EGA being the graphics standard that MOST computers have (by raw numbers) I dutifully define that as "current" graphics. VGA is NOT what the bulk of people have, though getting there, and would be "current plus." Having lived most personally with EGA for a long time, it's got an edge on 8-bit graphics, but they are comparable in many ways. When everyone has VGA or an Amiga, then it will be out of date. Certainly, we are on the edge of that time. 10+ years for any given design is pretty good though!

The 8-bit software is dated by virtue mostly of memory size. There is a real extended memory standard for 8-bits now, but it's nt being taken advantage of for the most part. The 8-bit DOES have a vast array of language options, utilities, and compilers - to it's credit. But I wouldn't look for too much ADA or C++ work on the 8-bit, indeed, a functional C compiler would be a step up. Too bad they went with a 128-char set.

If anything is "dead" on the 8-bit, it's the market. We have reached the point where I'm interested in knowing if anything at all is released for new sale. The entire market is NOT dead though. You can still get parts and supplies from several different suppliers. The used 8-bit market is rolling right along. Shareware software is cranking out stuff the likes of which we only wished for a few years ago. Bob Puff is some kind of junkie! And in the vacumn of commercial software, a lot of otherwise quiet places have felt free to release things.

A signifigant indicator of the state of a machine, I feel, is the demise of the magazines. The magazine market for a given computer is usually the best idea of how it's doing. In the 8-bit case, though, it's a bit strange, because even as the last magazine dies on the stands, the electronic Z-Mag is so

successful that they are looking to go to a printed format!

Another signifigant indicator of the state of a machine is what the ORIGINAL producer is doing. And in this case, nothing. Credit should be given for late Atari products like the XEP-80 which certainly are going to be hard pressed to make back the money it cost to develop them. Another big credit goes to Atari for the XE game system which, whether they realize it or not, was the best -possible- thing Atari could have done for 8-bit owners - creating a new, captive market of non-pirate compatibles. As even diehards begin bashing the company for its vile abuses of customers, it's important to remember that rarely is anything wholly good or wholly bad, and these are some damm big concessions to the 8-bits. However, it's historically true that when the original company stops working on it's product, it is a toll of the bell, and a cold wind blows through the 3-rd party support industry, no matter how big. Even the IBM PC's shuddered when IBM dropped all PC sales.

The thing to remember about machine "death" is that it is not an instant or atomic process. It's a sliding scale of the environment. From the peak of new products and excitement, (I STILL think they could sell 1450 XLDs in numbers, even now) to the waning days where you rarely find another person who has one, it's a slow continuous process. How far along is "dead?" There's no such thing. The question YOU need to ask is how far along can you go? The ultimate factor is always the machine - and it NEVER stops being able to compute. But can YOU handle the slowly declining support (sales, software, repairs, tech) by yourself?

For someone like myself, or Ken Sumrall, or several of the people online here, the answer is "forever." There will never be a machine "death" because none of us -really- needs any external support. If there are enough of these self-supportive people (who naturally help others) they form a "core" by which the other no-so-self-supportive people can continue indefinately. Indefinately? Well, the TRS-80 users were almost ALL techincal and thus the Mod I/IIIs still have active channels, even though the market "died" outright MANY years ago. It seems to me that A) given the suprising number of early technical people from the original 400/800 days, B.) the number of owners over three generations of machines and C) Z-Mag, a well spread, quality channel of news and info, that the "support environment" will die VERY slowly, indeed. And add all these new Shareware titles on top of that, it may even hold steady for a time.

Sorry about the book! Sheez, didn't realize. Can I turn this in and get some course credit?.

I'm not real up on new math, but how is

(320 X 192 X monochrome) > (640 X 350 X 16 colors)?

If that was a typo, and intended to be CGA, rather than EGA, then
I ask, how is even

(320 X 192 X monochrome) > (320 X whatever X 4 colors)?

I mean, player missiles and stuff like that are neat, and all that, but I'm not buying. I mean, I have two each 400s and 800s, and together they don't add up to EGA. Which brings up a point. Does anyone know offhand why Atari didn't use the TI sprite chip, instead of the (oh, shoot. I'm confused now. Was it the Antic that controlled the player-missiles? My father has all of the manuals and I can't remember offhand.) Am I misremembering due to my tender age and all that, or weren't those chips available at the time?

Ah, but resolution is not everything! If technology marches on, then why can I move my entire screen around hundreds of times faster on my XL than anyone else can on their IBM whatever or ST?

Why is it that the IBM's EGA card doesn't support IRQ's for horizontal and vertical sync? How come you can't overlay something on the screen without going through all sorts of code to mask it in and out? Why can't you change your colour selections on the fly, without watching closely (spending almost all your CPU time) to see when a status bit flips? Why use a blitter when a pointer does the same job?

Their graphics may be "bigger", but they are certainly not more advanced. In fact, they are a definite step backwards.

My little Atari does a fine job for what I ask of it: telecommunications, and an interesting platform to write assembly language and Forth code on. I may buy a PC clone in the future, but if I do it will be for job opportunities -- not for pleasure.

First, I would like to say, Mr. Mihocka, I agree with you that the old
8 bit isn't a top of the line computer..
and that I did not take your comments personally.
However, I will reply to each of your comments and questions with logical
reasons, and the then I will add my own thoughts at the end of this article.

****
In article <8135@microsoft.UUCP> w-darekm@microsoft.UUCP (Darek Mihocka) writes:

It is true that the atari 8-bit is old, but it isn't true that it's
technology is 'out of date'. It works on the same principles that the
newer 16 bit computers use, only it's processors handle smaller loads,
and it's operating system is therefore slower, and handled
differently.

>

>8-bit Atari any different?

Simple: Why would I want to spend $1000+ for a new 16 bit computer when I
just bought this 130XE less than 2 yrs ago, and I paid only $150
for it? It does everything I need at this time. None of my friends
on the net, and those who use 'forum' (a talk program wich allows
multiple net users to communicate, much like the unix 'write' command.)
seem to have any care wether I talk to them with my atari 130XE using a
vt100 emulator and 80 columns, or a newer 16 bit computer with the
same type of emulator (except for the 80 columns), or if I go down to
school and use the VAX machine directly. Another thing is,
VCR's don't change that significantly in how you operate them, a stereo
VCR still has a PLAY key, and recording is done the same; a car still has an
accelerator, and a simple brake. I wouldn't have to totally relearn
to drive to hop in that new car, I would have to learn a new OS,
and buy all new software for a new computer!
...accesories go simply from one car to the next, and
so does that VCR tape, and the cover...

> Yes, it may bring back warm and mushy memories
>of the days of trying to figure out whether Maxell or BASF tape works better
>with the cassette player, or trying to tune in your TV to get the best

>picture in Atari BASIC, or using modems that interface to the joystick port.

Bwahahahahahah! <sorry..>
I don't have those "fond" memories, I have a top of the line monitor with
composite and EGA graphics.., and two 1050 disk drives..
Not to mention an okidata printer (Okimate 10) and an SX212 modem.

>But it is not exactly leading edge. Sure, I've heard 8-bitters tell me that
>their computers work just fine and do everything they want them to, but usually
>these people were too ignorant to be aware of the capabilities of other brands.

I am fully aware of the capabilites of the "other brands", and of the advanced
Atari 16 bit line. Could you loan me $3,000+ dollars, so I could
get a new Mega 4? How about $5,000+ so I can buy a new Amiga?
No, thanks....they don't really do that much more (practicality-wise)
than my Atari 130XE, or my Commodore 128. (Yes, I do have a real 80
column computer...too bad it is no where near as reliable as my Atari 130XE.)
I find my C128 spending most of it's time in C64 mode, evidence that
it isn't the 8-bit that is dying, but rather Atari's poor management
and marketing that was the downfall of the 130XE and it's XL family.
Don't get too comfortable, the Atari ST is soon to join the 8bits
in a lack of support and software. The only Atari store in New Mexico
finally went out of business a couple of months ago. Most of the
software stores who quit carrying Atari 8bit software in the past few
years have dropped the ST software too. They know a company that failed
once will do it again...Yet why? Atari has great machines...
As for depemdability and reliability, my 8bits have never needed repair..
Not something I can say for any Commodore that I have ever known.
The reason Atari doesn't do well in the PC market is because they
never broke the myth that Atari means games...
My Atari hardly ever plays games....It is mainly a communication
computer.

>If you prefer to listen to a vacuum tube radio, that's your right. Don't go

Your comparison of a vacuum-tube radio to a comp stereo system
is outrageous! That is nowhere near the difference..
So, what do you suggest? Buy a new computer and software every year, or more?
Keep up with the constant improvements in computers? That is outrageuos!

> So let nature take its course.

What ever that means! This has nothing to do with nature..it
is purely human-kind.

>The 8-bit is dead. Forget about it. Bury it. Deep six it. Get out of the

>(519)-747-0386 A mind is a terrible thing to waste, so JUST SAY NO TO TOS.
>Opinions expressed are my own and not those of anyone not named Darek Mihocka.
>---

If you think nothing of the atari 8-bits, then why do you waist your time
reading our news group? Are you truly that bored with your
'superior' computer's abilities?
Why pick on those who are happy with what they have? Are you not happy?
BTW, I'd love to see this computer that can run 100 times faster
than my 8-bit, for only 1500-2000 dollars..

I think it is quite funny that you waisted $900 on an 8-bit, and now you
say what a waist they are...foolish indeed.

If you are willing to throw away a few thousand here, and a few thousand there,
it is entirely your choice. I have never forced my 8-bit on anyone, nor
do I recommend it to anyone, but people like you who tell me and other
Atari eight bitters that they shouldn't be happy have no right to
do so. On many occasions others have posted articles much like yours,
if I wished to upgrade to a new computer and leave my Atari 8-bit
behind I wouldn't be reading this!

Now, if you have nothing to say that would add to what we find as
useful information for our 8-bits, I suggest you stop this waist of
band-width on the net... If you have a reply, send it to
me at cs2531bz@carina.unm.edu.UUCP, I would be happy to tell you what I
think of you and your hotty opinions. I like my Atari 130XE, I wouldn't
die for it, nor will it always be my main computer, but for now it is,
and I enjoy it, so thankyou, and please go back to your 16-bit newsgroup.
If you haven't noticed, they have a newsgroup for your ST, use it, and
stop cluttering up our newsgroup.

BTW, since I do owe a few of you the vt100 emulator which will work
with the SX212, I want you all to know, I am almost finished writing
a unix uploading program, so I can get that to you, sorry it
has taken so long!

2641. Broken 1050

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-23 21:37:34 UTC
From: ronh@sunriv.UUCP
Message-ID: <191@sunriv.UUCP>
Source record: 115395

I recently acquired an 800XL, 1050 disk driver, and several carts, including MAC/65, for almost nothing at a local pawn shop. Everything works except the disk drive which will not write to diskette. Have any of you every had this problem? Also, I need information on how and where to obtain the following items:

Technical or service documentation for 800XL and (especially) 1050.
Documentation on writing device drivers.
User documentation for MAC/65.
Replacement parts and 3rd party products.
A serial and parallel port card.
An 80 column display adapter that will drive a TTL monitor.
A c compiler.

For the serial and parallel port hardware, I am primarily interested in either a design that attaches to the parallel bus connector on the 800XL or a description of the signals on that connector. With the signals and pin out, I can build a serial and parallel port card and (maybe!) write drivers for it myself.

PLEASE reply by email. Thanks in advance for all your help.

The price performance ratio for 8 bits in getting better all the time!

hello,

First of all, sorry for the mess in the last two attempted notes;
this modem cable is terrible.
Anyway, I need help on getting some useful texts and software for my
8 Atari still available? Are there any good assembler programs?
Are there any good texts on Atari internals? Where can I get interesting
PD software? Where is the ftp site for the C compiler (msg. ~4,5)?
Basically I am rotting on old software that's a few years old and not
any fun anymore, and I am really interested in assembly programming.

Please respond,
Ernest C. Spieu!

You're not very specific as to which C revision ROMSs you refer. I assume you're talking about the Rev. C BASIC. I don't know if you can still buy the Rev. C cartridge, but an easy solution would be to find a friend with a 130XE (which has Rev. C BASIC), save to disk (from DOS 2.5 menu option K) the BASIC cartridge ($A000-BFFF), then write an assembly language header to precede the file you just wrote. The assembly language header will have to disable the BASIC ROM on your XL, then load the disk BASIC into the underlying RAM, then reset RAMTOP to $A0, then clear the screen (by opening and closing device #0). Then, just do a JMP $A000 and your Rev. C BASIC from the disk will run on your XL.

>Do you get a linear space of 64K of just RAM? If not, are the device
>registers accessed in the same way as when ROM is on?
>Thanks. -Stan
>
The address bus is wired so that if you try to access a register from
$D000-D7FF, you access a device register instead, regardless of the way
the memory 'windows' are configured. Therefore, only 62K is available
at any time. (If you have >64K, the extra memory is accessed through
a memory window at $8000.) You might want to switch off all interrupts,
and copy the OS ROM in segments to the RAM underneath, then reenable the
interrupts, so you can still leave the core of the O.S. running, and
overwrite parts of the O.S. that you won't be using (like the floating
point routines, or the printer or cassette drivers, for example). This
seems to me to be a bit more practical, since unless your program is
purely computational, you will probably want some sort of interface
between the user and the computer, and if the O.S. is gone, displaying
things becomes a bit complicated.

2653. VT100 emulator problem.

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-25 14:04:44 UTC
From: rrwood@lotus.waterloo.edu
Message-ID: <17537@watdragon.waterloo.edu>
Source record: 115407

I've managed to get a VT100 emulator working with my direct-connect SX212, but a strange thing has happened (as strange things are wont to do). When I first call into my Unix account at the local university, the software displays upper and lower case, but as soon as I've entered my password, all I get is upper case. More precisely, all lower case letters are displayed as upper case letters, and any upper case letters are preceded by a "\". I assume that this is what is being transmitted by the Unix system, because this sort of thing doesn't happen when I call a simple BBS.

Does anyone have any ideas?

Also, I previously asked if anyone out there is using an 80-column word processor, but I didn't really get much response. Has no-one ever tried the new AtariWriter, or any of the other wp's available?

Do you mean that are subscriptions will come to a screeching halt, or are they merely combining Analog with their ST mag (STLOG?) similarly to what ANTIC is doing? I suspect that both magazines are combining their 8 bit and 16 bit coverages into one magazine and that both will go to disk only subscriptions.

I am fairly sure, actually, that it would be considered a copyright infringement to post the program here, even if it is a small one...oh well. It would probably be wiser just to give the issue numbers.

STlog and Analog will be merged into one mag. Analog was the best Atari mag out there - and STlog was good too. I haven't read Analog in years but STlog went down the toilet (IMHO). Bad magazines just waste advertising dollars that good magazines could use to become even better. I hope they go under and Larry Flint loses money.

Um... I think you'll have problems with that binary save from DOS 2.5. If 2.5 works anything like 2,0 in it's burst mode writes, then it will attempt to write the cartridge out in burst mode, and totally mess up the sector links, yielding an undeletable useless file. Best to either turn burst mode off (the pokes are in Mapping the Atari under FMS), or write a small basic program to dump the ROM space to a file. Something like...

```
10 OPEN #1,8,0,"D1:BASICC.OBJ"
20 PUT #1,255:PUT #1,255:REM $FFFF file header
30 PUT #1,0:PUT #1,160:REM $A000 start address
40 PUT #1,255:PUT #1,191:REM $BFFF end address
50 FOR ADDR=40960 TO 49151:PUT #1,PEEK(I):NEXT ADDR:REM body
60 END:REM close too

Now, now, Marc. Calm down. You started your message in a civilized manner, and ended up calling me a fool and told me to get off this newsgroup. Now that's not polite, and doesn't indicate to me you used any "logical reasons".

I have as much right to use this newsgroup as any other user. As a former 8-bit user who has seen the errors of his ways, I feel that I can offer some points of view that 8-bit users like yourself have shut their eyes to. It's no crime to admit that you made a mistake and bought the wrong computer. Now, I'm not saying "go and buy an Atari ST" (that's hardly a good buy nowadays anyway) or "go and buy a 386", but as with any technology, you should not shut your eyes to new advances. Let's look at some of your remarks:

>Simple: Why would I want to spend $1000+ for a new 16 bit computer when I
>just bought this 130XE less than 2 yrs ago, and I paid only $150

A common belief amoung 8-bit users is that their computers are cheaper than others. A stock $150 130XE is about as useful as a hole in the head. What can you do with it? Plug it in and watch the READY prompt. You need a disk drive, or even two to do anything useful. Add another $300 or so. Unless you have a good health plan to cover eyeglases, you'd better get yourself a real color monitor and leave the TV for watching movies. Add another $300 or $400. And let's not forget that 256K or 512K memory upgrade which everyone seems to be getting these days. I don't know what they go for. Say $100. And you have to get SpartaDOS X because everyone says it the best DOS to get. Now, already you're spent close to $1000 to make your XE useful. What you've got is the equivalent of a 520ST with color monitor. A 520STFMD goes for about $400 or $500, and the monitor is about $300 or $400, so you see, the 8-bit system cost you about the same as the ST system. And if you consider IBM clones, you can get them for even cheaper! My 1040ST and 20 meg hard drive cost about $1500 3 years ago! Hard drives, modems, printers, and other accessories are going to cost you the same, whether you own an 8-bit, ST, IBM, or whatever. So put this lie about low price to rest, will you?

> I would have to learn a new OS, and buy all new software for a new computer!

Well, unless you plan on using computers _only_ in your home, you'd better get used to the idea of learning other operating systems. I've got news for you. Operating systems on 16-bit machines are a lot more use friendly and their programs don't put "please wait. initializing" on the screen all the time.

>I am fully aware of the capabilites of the "other brands", and of the advanced
>Atari 16 bit line. Could you loan me $3,000+ dollars, so I could
>get a new Mega 4? How about $5,000+ so I can buy a new Amiga?
>BTW, I'd love to see this computer that can run 100 times faster
>than my 8-bit, for only 1500-2000 dollars..

Once again, we're back to the price issue. Your ignorance of the real world
is amazing. You speak of the 386 machines as if they do not exist. Under $2000
386 systems have been around for about a year now. Once again, I will repeat
my point about early prices of the 8-bit machines. When they first came out,
a 48K Atari 800 system with disk drive cost about $2000, 1980 dollars too!
In 1989 dollars, that is _more_ money than what a 386 system costs. Now if in
the early 1980's, so many people bought the Atari computers because of their
advanced technology, even though they were paying more for them than they
would for say, a cheap Apple II clone, then why the sudden about face?
You said it yourself. Your friends would not care if you telecommunicate on
an Apple II, or Atari 400, or ZX81. Why did you buy the Atari?
I suspect you are an Atari dealer groupie. I'm not saying go to Computerland
and take a look, since they probably wouldn't let you in. But there are a lot
of small dealers who will take the time to show you the other machines and
give you a good deal. A friend of mine just bought a 12 MHz 286 machine with
40 meg hard drive, printer, and EGA monitor for under $2000. Funny thing is,
he bought it from an Atari dealer who has turned to selling IBMs so he can stay
in business.

>The reason Atari doesn't do well in the PC market is because they
>never broke the myth that Atari means games...
>
Well, I find it hard to believe that Atari's are good for anything but games.
Just look at the new Atari STE. 6 damn joystick ports!

>If you think nothing of the atari 8-bits, then why do you waist your time
>reading our news group? Are you truly that bored with your
>'superior' computer's abilities?
>Why pick on those who are happy with what they have? Are you not happy?
>
>I think it is quite funny that you waisted $900 on an 8-bit, and now you
>say what a waist they are...foolish indeed.
>
I was once fooled into the power without the price myth too. I was 14 at the
time. Excuse me for not having better judgement or the benfits of services
like Usenet to get other people's opinions.

>Now, if you have nothing to say that would add to what we find as
>useful information for our 8-bits, I suggest you stop this waist of
>band-width on the net...
First, I would recommend that you learn to spell the word "waste". Secondly,
who are you to censor my opinions? An ignorant 8-bit user who does not know
what he's talking about. At least if you had been able to make some valid
points I might have taken you seriously. I am not saying some brand of computer
is better than some other brand. I am saying that there comes a time when old
technology must be put to rest, and the time has come for the 8-bit computers

(all of them, not just your beloved 130XE).

Analog and ST-log merged with the Nov 1989 Issue.
As I subscribed to both, when I called to discuss the correct expiration
date of the new combined issue I was told to not worry about the date in
1990, as they had decided to cease publication in 1989.

Hey anyone who can help,
How do I properly download stuff from the FTP site?
When I tried the Unarchiver that I downloaded from the 8bit site,
It totally choked on me. And all the rest of the stuff is ARC'ed,
so I'm stuck. This is my procedure:
At ftp, change directory to atari.8bit
Then issue a BIN command
Then GET or MGET as the case may be
Then I get back into UXA and SX (FILENAME). This works and
I transfer the file OK, but I can't seem to run it properly.
I am talking about the SUPUNARC.COM file; I don't know if I
downloaded properly, or I am runnign it wrong; I tried binary loading
it from DOS 2.6f with and without BASIC and it screws up. CAn anyone
straighten me out?

>of view that 8-bit users like yourself have shut their eyes to. It's no
[....]
[you should not shut...]
>eyes to new advances.

Thanks, but as I said before..I am tired of pople like you trying to show
us the 'errors' of our ways.....
I did not buy the 'wrong' computer....I bought a very versatile, and fun
computer...for an 8-bit......
I have considered many computers that are better in some ways than my
130XE! I am going to eventually buy one, but not until I find one I really
like! The NeXT looked promising...but I don't have $5000 or even $500
to invest in any computer right **--now--** !
I will admit, before I continue to answer your reply, that I did
get a little too abrasive, and I apologize. It's tough to stay
logical at 2 to 3 am!!! Right now it's 2:57, and like that night, I've
just gotten off work (cooking on the broiler at Chili's); quite exhausting
work, yet I stay wound up for a couple of hours after work..

>A common belief amoung 8-bit users is that their computers are cheaper than
>others. A stock $150 130XE is about as useful as a hole in the head. What
<<examples of prices ad comparisons to other computers deleted..>>

This hole-in-the-head is what I am writing to you with RIGHT now..
The equipment I have with it are:
130XE -- 150
1050 -- 150
1050 -- 20 (got it from a friend. Used one's go for about $50..)
SX212 -- 75
Oki 10 - 250 (got it when it was brand new stuff....Used go for less than 50)
(printer)
Magnavox 350 (supports RGB and composite...RGB for my C128)

995
True, it wasn't cheap...but that was only 1 to 6 yrs ago!!
130XE: 2yrs ago 1050: 2yrs and 3 months SX212: 6months
Oki 10: 4yrs Magnavox: 2months
Then, there's my old 600xl (sold it) over 5yrs....and my old
GE tape drive ($50) 5yrs ago too!
But, the biggest hurt is the software: over $400 in software....

including Flight Sim II, Paperclip II, Star Fleet I, XE games...
Not to mention the shareware!

>Well, unless you plan on using computers _only_ in your home, you'd better
>get used to the idea of learning other operating systems. I've got news for
>you. Operating systems on 16-bit machines are a lot more use friendly and
>their programs don't put "please wait. initializing" on the screen all the time

I know other operating systems...Unix for one.
And I am aware I will have to learn new OS's...I just don't want to have to
do that right now for my home, since I am busy learning one's at school...
The NeXT is Unix based, so it wouldn't be so bad...I really would like to
get a computer that has a unix OS, as DOS is soon to die.

>Once again, we're back to the price issue. Your ignorance of the real world
>is amazing. You speak of the 386 machines as if they do not exist. Under $2000
>386 systems have been around for about a year now. Once again, I will repeat
>my point about early prices of the 8-bit machines. When they first came out,
>a 48K Atari 800 system with disk drive cost about $2000, 1980 dollars too!
>In 1989 dollars, that is _more_ money than what a 386 system costs. Now if in
>the early 1980's, so many people bought the Atari computers because of their
>advanced technology, even though they were paying more for them than they
>would for say, a cheap Apple II clone, then why the sudden about face?
>You said it yourself. Your friends would not care if you telecommunicate on
>an Apple II, or Atari 400, or ZX81. Why did you buy the Atari?

I am not ignorant of the real world....I KNOW tht there are more important
things in reality than keeping a 'top technology' computer in my home
at each change... The REAL world my friend, doesn't revolve around personal
computers, and what kind you own! Might I ask what it is you do for a living?
have you ever had to work a truly tough 8-12hr day? I've done 17hr days,
have you? have you ever worked on a non-white collar job? THAT'S the REAL
world! BTW, a computer that operates at 100 to 200MHZ I would LOVE to see for
less than $2000!!!! That is what a computer that runs 100 times faster than
mine would be! A VAX runs about 25 to 36MHZ...Those are incredible speeds!!

>I suspect you are an Atari dealer groupie. I'm not saying go to Computerland
>and take a look, since they probably wouldn't let you in. But there are a lot
>of small dealers who will take the time to show you the other machines and
>give you a good deal. A friend of mine just bought a 12 MHz 286 machine with
>40 meg hard drive, printer, and EGA monitor for under $2000. Funny thing is,
>he bought it from an Atari dealer who has turned to selling IBMs so he can stay
>in business.

i am not an Atari dealer groupie..that would be impossible in NM...
Our last Atari dealer went under this year....
I have been in Computerland plenty of times, and not truly impressed!!!
When I get my next computer, I want to REALLY be as impressed as I was with
my 130XE!!
I have a friend who just did that same thing, only a 20Meg hard drive...
As for user friendly...nope! DOS is a bitch...he still is having troubles
with many functions. I'm supposed to sit down and help him someday..

Our dealer did the same about changing to IBMs and other computers as well..
they still went under.

>Well, I find it hard to believe that Atari's are good for anything but games.
>Just look at the new Atari STE. 6 damn joystick ports!

Yeah, it's true they are good at games, but that doesn't limit them to
games...

>First, I would recommend that you learn to spell the word "waste". Secondly,
>who are you to censor my opinions? An ignorant 8-bit user who does not know

>technology must be put to rest, and the time has come for the 8-bit computers
>(all of them, not just your beloved 130XE).
>
>- Darek
Real nice ending there.....
I thought you were dissapointed with my closing, then why come back with the
same lousy attitude?
I am definetly not ignorant....
I do know what I am talking about. Many friends and co-workers come to me
when they are looking for a computer... Not one has been unsatisfied
with the computer they have bought due to my input.
They haven't bought Atari's, but rather IBM clones and the like, so I know what
I am talking about on prices..
I had many valid points which you just kind of swept under your delete
key....and a few which you argued with.
The computers you mentioned for around $2000 I wouldn't buy, even if I did
have the money. I will only go to the top of the line, best and
most versatile computer for my next one.
Sorry about spelling waste wrong...
BTW, I heard that you are the one who wrote the STXFormer, better know as the
8bit simulator for the ST computers. Looks to me like you really do
like the 8bit and it's capabilities...It takes a lot of work to write
an emulator, so it wasn't just a 'for the heck of it' type of project...

I need help. I've been trying to download programs from FTP, such as K65 which is a kermit program and Omnicom which is also a kermit program. I have gotten them to my BITNET account and I have unARCed them, but I cannot get them to download into my home computer. I was using URI's KERMIT program to send the m, but they will not be sent to me. I do not have a kermit program, but my mode m does support X-modem protocol, which I was told will work. I was wondering if there was a way to get a kermit program off of the system with out already hav ing one. So that I can use it to get other programs. I have an Atari 800XL with a 1050 disk drive and a MMP1000E modem (has X-modem protocol). Please help

Thank you,
Scott Glynn

No, I've tried it, and it works, and I read somewhere that they fixed that
burst-mode stuff for DOS 2.5. I believe it copies it to a RAM buffer before
writing the sector link information. Anyway, as I said, I tried it, and
it works, so I think it's pretty safe.

2670. Re: 8) Research Help (8

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-27 16:08:18 UTC
From: jdd@db.toronto.edu
Message-ID: <1989Oct27.120818.1578@jarvis.csri.toronto.edu>
Source record: 115424

The question of whether or not the Atari 8-bit is an obsolete computer is one that's near and dear to every Atari 8-bit owner's heart - because it IS an obsolete computer. I doubt if '386 owners worry too much about whether their machines are obsolete or not, because they're not.

I don't think it's a good idea to choose the Atari 8-bit for a new computer, because there are much more powerful and capable computers available for a similar cost. But many of us (like me!) bought our Atari 8-bits when they were a much better deal. I'm not prepared to fork out $1000 for a new machine right now, so I have to make do with the Atari 8-bit system I forked out $500 for three years ago (800XL, plotter, 1050w/USdblr, amber monitor, s/w; it was used, though). Yep, it's obsolete. Yep, it does the same kind of stuff as it did when I bought it. Yep, there are lots of machines out there that do a whole lot more (I'm typing this message on a UNIX box which makes my Atari look silly). When I get a new machine, will it be an updated Atari 8-bit? Certainly not! But until I get a new machine, I'm still interested in my 8-bit.

Marc, your 8-bit is still good for something, and people like yourself or myself who still have some interest in an 8-bit will keep the market going (somewhat). But Darek, you're absolutely correct in stating that there's not much future in the 8-bit market, especially for new machines. (There's the 8-bit 'video game' market - that's another story)

One caution for Marc and other Atari 8-bit owners out there: don't let your fondness for your machine and your sense of nostalgia interfere with your decision-making capabilities. Eg: is it really worth it to buy a MIO and a hard disk for $1000 and run it on your 8-bit? Why don't you buy a cheap PC and stick the hard disk on it? You still might decide to go the MIO route, but make sure your reasons are good.

John

BTW, Darek, I still use your GUP package occasionally.

Really? How did you arrive at that determination?

And define cheaper!
Based on a feature by feature comparison? Are you including features the
customer may not want? Are you discussing a brand new system or upgrade
paths for existing owners?

>Now, already you're spent close to $1000 to make your XE useful. What you've
>got is the equivalent of a 520ST with color monitor.
I think you missed the point. Most 8 bitters already have hardware
they have gotten over time. I certainly would not recommend a 8 bit
as brand new high tech machine.
But for me, the 130XE system was only $130 because I was already
an 8 bit owner and had other hardware. Another example is that I can get
a useful terminal emulator by simply adding a XEP80 for ~$80.
PS, the disk drive is only ~$180 mail order.

>> I would have to learn a new OS, and buy all new software for a new computer!
>
>you'd better get used to the idea of learning other operating systems.
Typically CS attitude: I have a great new system for you and too bad if
you are comfortable with your current system. Throw out all your
software also.

>>I am fully aware of the capabilites of the "other brands", and of the advanced
>>Atari 16 bit line. Could you loan me $3,000+ dollars, so I could

Smart move. Different strokes for different folks. Are you suggesting

that everyone should own PC compatibles and that no alternatives such
as ST and AMIGA should exist?

>>Now, if you have nothing to say that would add to what we find as
>>useful information for our 8-bits, I suggest you stop this waste of
>>band-width on the net...
>who are you to censor my opinions?
True, but I would like to point out that in my opinion these articles lack
tact and I find them irritating. Concentrate on comparisons of
capabilities, price, support, etc. particularly with respect to
things the 8 bit Atari can do. Keep in mind that you want to compare
both new machine sales as well as upgrades to existing systems.

Hey, there's a question I feel qualified to answer!

Zmag is a weekly online Atari newsletter that for years was
distributed to BBSs by its editor, Ron Kovacs of Piscataway, NJ, not
far from here. Ron is a hard-working Atari devotee who put the thing
out for free. I don't know the current status of the electronic
version, but I do know that a printed version that accepts advertising
is currently being distributed to Atari user groups nationwide for
free, and that many groups include it in their printed newsletters.

Zmag used to be posted weekly to this newsgroup, what happened?

>A common belief amoung 8-bit users is that their computers are cheaper than
>others. A stock $150 130XE is about as useful as a hole in the head.
[...]

I believe what Marc was saying was it's cheaper for him (and me!) to
get a new 130XE ***and use the peripherals we already own*** than to
get an entirely new machine and new peripherals and new software. You
misinterpreted his statement.

>First, I would recommend that you learn to spell the word "waste".

Pretty low, Darek!

I think that this "discussion" has degraded to the point of being
simply ranting and raving and lots of hand waving and finger flipping.
The facts are: some of us don't feel that our computing needs require
a more up to date computer; some of us feel that everyone should have
the latest model. This is like a lot of other issues, say abortion,
for instance. Either side is going to be hard pressed to convince the
other that it is wrong. I propose that we drop this discussion and go
onto more informative postings from people who have knowledge about
8-bits and are willing to share it with people who want to use their
computers better.

>You're not very specific as to which C revision ROMSs you refer. I assume
>you're talking about the Rev. C BASIC. I don't know if you can still buy the
>Rev. C cartridge, ...

It may be simpler than that. I wrote a letter to Atari Customer Support to ask how I could get my Rev B Basic upgraded to Rev C, and the reply stated that I should send a copy of my receipt for purchase of the unit, and they would send me a Rev C cartridge. Since the receipt had been tossed, however, I was unable to comply.

This was a few years ago; I don't know whether the offer is still good. In retrospect, it would seem that one should also be able to pop the PROM out of the machine and send that in; however, I don't know that this would be an acceptable alternative to Atari.

2677. Atari 8-bit dead?

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-28 00:55:31 UTC
From: walshm@image.soe!clutx.clarkson.edu
Message-ID: <1989Oct28.005531.14092@sun.soe.clarkson.edu>
Source record: 115431

The Atari 8 bit will never die. This does not mean that software and hardware support will ast indefinately, but it does mean that the Atari still is capable and will always be capable of doing many things quite well:

For example:

1) Despite the fact it uses a square sound wave generator, the Atari's sound capabilities are still \quite good. It beats the Nintendo hands down, and certainly puts the IBM PC to shame. It remains the only computer with true random number generation, meaning it can generate white noise like nothing else can. Lee Actor's AMS is a useful and versatile music program which will always be useful to anyone who wants to hear how a piece of music will sound in four voices. It's not fancy, nor user friendly, but it works and works well. Also keep in mind that an 8-bit makes a good Midi controller, although much more powerful sequencers and computers are available. Still, it's a cheap way for existing owners or new comers to get some decent midi capability.

2) I know of no computer built as ruggedly as the Atari series. I put my poor 8 bit through so many projects and road trips that I was and still am amazed it held up for so long. Anyone who has ever worked with its joystick ports knows it incorporated safety features such as it will automatically cold boot after shutting down (all by itself) if you accidently connect two of the wrong pins together.

3) The Atari also is capable of doing some good word processing. At the school I attended for fresh-soph year, each of us was given an Zenith 286 compatible. After using the bulky programs like wordstar, I longed for the quick and simple Atariwriter Plus. It had all the features I needed, plenty of room with the 130xe, spell checker, etc. and produced nice results. I think just the Word Processing justifies having an Atari.

I'm not trying to tell anyone that the Atari has any mystic power that makes the everlasting computer. It had a good design and construction, and this makes it capable of doing quite a lot considering its age and competition. Wheter its 1989 or 2089, people will still have to write papers, and write music, and the Atari can do these plus alot more. It's a good ,down and dirty, workhorse that though it may pale in speed and memory size, remains something useful to have.

Final note to pinball fans:
Your Atari computer possesses more processing power than any pinball computer (Data East or Williams). Think about how much data a pinball has to absorb and process - 3 targets being hit simultaneously in multiball while music is playing and lights flashing and numbers being added. And unless you have some pinball experience I would appreciate refrain from flames about this last

point.

Source record: 115432

I think this discussion had gotten wayyyyy too depressing. It's degenerated into Darek v. everyone. I'll try to point out that there are some things the 8-bit can do CHEAPLY and effectively. I think it's possible to get real cheap if you don't get a disk drive and printer (that's a $500 savings if you get the requisite two drives.)

Terminal emulation. With the XEP-80 and a SX212 (total extra cost $170 or less) you almost have a pretty decent terminal emulator. "All" that needs to be done is to get an XEP term program copied onto a cart :-) I admit it sounds like a pain in the *ss to realize now, but I imagine that some dealer would be able to make a package like that.

LOGO. LOGO is a good language to learn computer science in. The Atari has (had?) a very powerful LOGO interpreter once upon a time. Maybe someone still has some carts. You might need to get a disk drive if you want to actually write somthing useful in it, but for teaching things like recursion, language parsing, trees, list processing, and data structures, you can get by without a drive. The book _Computer_Science_LOGO_Style_ had its examples done on an Atari (and it's a good intro to computer science too!)

Playing games (of course.)

Video Titler for cheapskates. I've used my family's old 800 for that purpose many times. Sure, you don't have Genlock, but you can hack some pseudo-amazing things in BASIC without ever turning the disk drive on. If you could ROM some neato animations... :-) :-) :-) If you have an 800 you can get the chroma/luma info separate: maybe this can be used directly by hi-8 and/or super-VHS.

:-) With a PR: connection you can be the terminal for a high powered QMS 1240 DPI PostScript compatible laser printer. Just Imagine :-) :-) :-) :-)

Hey anyone who can help,
How do I properly download stuff from the FTP site?
When I tried the Unarchiver that I downloaded from the 8bit site,
It totally choked on me.

Precisely what does "totally choked" mean? Refused to load? loaded but then errored? Melted down your computer?

And all the rest of the stuff is ARC'ed,
so I'm stuck. This is my procedure:
At ftp, change directory to atari.8bit
Then issue a BIN command
Then GET or MGET as the case may be
Then I get back into UXA and SX (FILENAME).

That should work. Is the byte count of you local copy the same as the one in the archive? (should be 10279, for what's there now)

What are you using for the receive side of your Xmodem?

This works and
I transfer the file OK, but I can't seem to run it properly.
I am talking about the SUPUNARC.COM file; I don't know if I downloaded properly, or I am runnign it wrong; I tried binary loading it from DOS 2.6f with and without BASIC and it screws up. CAn anyone straighten me out?

It's entirely possible that you're losing due to the dreaded Xmodem bug. Due to lack of foresight on the part of the designers, Xmodem can only transfer things in multiples of 128 (or some power of 2, maybe 256?) bytes. Space off the end is filled with ^Z's. Sadly, your Atari doesn't know from files that were written with garbage at the end, and attempts to binary load the ^Z,s thus scribbling in memory that it shouldn't. Things go downhill in a hurry.

If that's the problem, you might be better off transferring things as uuencoded text, at least until you can ARC bootstrapped. I've put a uuencoded copy of Supunarc in the terminator archives. Grab the text, download it as text, and use the BASIC uudecoder to untangle it, unless you've already got YAU or something. If you only have access to a version of Xmodem that doesn't understand the concept of text files, download the text as binary, and write a little basic program to clean it up.

That should leave you with an executable without garbage, which you can then use to unpack the other files.

No typo there - I meant EGA. Having done EGA emulation under a multitasking DOS operating system, I'm MORE than familiar with it!

You can't compare any graphics on raw resolution. It is, to some extent, application specific. Certainly CAD is better suited to higher resolutions with precision. But most people dont realize that color choice is far more important than pixels.

Consider the pictures on your television set. TV is of amazing quality. How good is TV resolution compared to EGA? A few million times better? Actually, it's the other way around. Television is only 160 X 200 (or so) hi-res. (Remember that 8-bit's 320 resoultion is HALF a color clock, which is basically a pixel.) On the other hand, it's in 16 Million colors! (well, analog!)

EGA can't touch the 8-bit's 256 color onscreen capacity. Likewise, sprite support is worth a LOT. Try doing sprites on an ST or EGA. These bit-mapped screens are great - but on an ST, every sprite you draw IS going to steal a color - and there aren't that many available.

The fact that EGA is slower than molasses might be worth mentioning.

In the speed vein, the 8-bit's redefinable character sets are a GREAT tool for fast, super compact graphics. Look at Bruce Lee, a masterpiece in character graphics. It's hard to believe that that game fits IN MEMORY with all those animated, colorful hi-res screens. Enter 4-color character set mode.

The 8-bit may lose in CAD apps, but when it comes to overall graphic output, the 8-bits power tools easily match EGA's slow-and-simple approach.

Source record: 115436
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

For Sale:

1 Meg Multi Input/Output Board from ICD

Features:

o 1 Megabyte of Memory configurable as RamDisks or Printer
Spoolers

o Parallel Printer Port

o RS-232 Serial Port

o Small Computers Systems Interface (SCSI) for connecting Hard
Drives

o Expansion Connector

Also included is an adapter for a 130XE. This also gives you
two cartridge ports instead of one.

Price: $300 for both. You pay shipping.

ICD currently sells this for $469.95, no discounts, and that
doesn't include the $19.95 adapter.

I can be reached at (606)276-3375. If I'm not here the answering
machine is. My address is:

Greg Parsons
222 1/2 Reed Lane
Lexington, KY 40503

2683. A former 8-bit user's testimonial

Newsgroup: comp.sys.atari.8bit
Date: 1989-10-29 22:16:11 UTC
From: jca@pnet01.cts.com
Message-ID: <616@crash.cts.com>
Source record: 115437

I unfortunately have to agree with the association with Atari 8-bit and obsolete. Back in late March '88, I got rid of my Atari XE system which was only really missing an MIO board to make it complete. The reasoning was simple, "what the hell can I use it for?" The Atari 8-bit system did serve a a good foundation for my background in computers in general. I picked up BASIC and assembly on the thing, but what I wanted to do with the system and what I more or less had to do to get my foot in the door professionally required me to upgrade to something more powerful and standardized. What I find interesting is that I didn't start out on an IBM XT clone or a DEC VAX, but yet from my experience with computers in general I might as well have. One of the motivating factors in dumping my XE system was my introduction to Unix. After a love hate relationship with System V and later becoming acquainted with BSD 4.2 and 4.3 I decided in the back of my mind "I want a machine that will run this or something like it."

Atari made several mistakes in designing the Atari 8-bit machines, one was the lack of a standardized scheme for 8-bit machines to have memory greater than the 64K address space of a 6502. Why couldn't Atari follow do was Lotus, Intel, and MicroSoft did and design a standardized spec for how ALL memory greater than 64K on a 6502 would be accessed and always be accessed? But Atari didn't, several third party manufacturers had their own ideology of how to put 'expanded' memory in an Atari 8-bit and did it their own way. Now as of the XL/XE, there is a standard, but those of you with the old Atari 800's are out in the cold.

One thing that I did propose in my final days of being an Atari 8-bit user was using the 65816 chip in a new system called an XS. It would be have an Atari 8-bit compatable mode and a 16-bit mode with its own OS, ROM, up to 16 Mb of addressible memory, etc. But no one would listen. Now what happens? This Turbo-816 motherboard upgrade comes out. Hmm, maybe I was right about something? I knew it was very possible, even went to the trouble of looking over the data sheets and specs for the WDC 65816, but everybody thought I was crazy (not an unusual opinion of me in the Atari 8-bit community). If the T-816 upgrade really takes off, it can beat an 80286, in fact, the chip is much more neater in design than the 80286 and porting an OS such as Minix to it wouldn't be too difficult providing provisions are made for multiple interrupts to bring it up to par to the 80x86 in programmed I/O and interrupt handling.

The problem with you diehard Atari 8-bit users is that you're happy with what you have now, and now a company puts this 65816 daughterboard in your lap. I would love to see somebody get off their duff and make the 80286 look like the brain damaged CPU it really is, and if done properly you will have the best of the Atari 8-bit world and a gateway into a new Atari 16-bit world which is 8-bit world compatable. The hardware, engineering knowledge, and programming

knowledge is there, I just never seriously followed it because of lack of time and my need for a Unix capable machine back then. I would love to see a T-816 develop into a product that motivate me to buy another 130XE and a T-816 daughterboard kit rather than a new 386 box. There's still time for you people to do something, but if you sit there content with what you have that was good a few years ago, it isn't going to happen.

And the longer you wait, the less of a chance of making it catch on. The Apple //gs has a market base, albeit it small in comparison to the Mac, but it is there. The choice is collectively yours. We are in the era of 16 to 64 bit processors now. The 8-bit processor is a breed about to be made extinct.

>colors! (well, analog!)
Ah, no. Television is _not_ 160x200 resolution; it's closer to 520x400.
Remember; the interlaced "second screen" is independantly addressed, and
therefore counts both technically and in visual impression. Now, in terms of
effective resolution; well, cable TV and laserdisk, on a decent screen,
pretty much reach television's resolution. A third generation video tape, on
the other hand, will drop down pretty low - but even then, nowhere near
160x200.
That's full-screen, of course. TVs don't have graphic display regions with
edges.
Analog colour literally gives you an "infinate" set of colour values;
of course, one quickly (relatively speaking) reaches a point wherein colour
n and colour n+1 are not distinguishable on the cruddy phosphor most TV sets
use...

2687. 65c02 vs Pitfall

Newsgroup: comp.sys.atari.8bit
Date: 1989-11-05 22:16:01 UTC
From: ehs@jumbo.dec.com
Message-ID: <14203@jumbo.dec.com>
Source record: 115442

I had an 800 that was upgraded to make it a reasonable 6502 development system. Having no time to use it myself for the past year or so, I gave it to my son, who uses it mostly to play Odesta Chess.

Recently he wanted to play Pitfall. Neither the original Activision cartridge nor a disk version from Solid Gold Software would run. Everything else (including Pitfall II) seemed to run fine. We began removing the upgrades one by one. When I removed the 65c02 and replaced it with the original 6502, Pitfall started running correctly.

As I recall, the behavior of the CMOS 65c02 differs from the NMOS 6502 in the following ways:
(1) a bug when the operand of a jump straddles a page boundary was fixed.
(2) the 6502 has some opcodes that are undocumented (and not guaranteed by the vendors) but have well-defined effect; some of these were turned into legitimate, documented opcodes with different effect in the 65c02.
Does anyone know what incompatible feature was used by Activision, whether it was intentional, and if so why?

I have previously sent this posting to the boys at the pc dept. but the didn't seem to know anything about the machine,so I come to you :

I am seriously thinking of buying a PC at the moment and I have basically decided on one of two models,

1)ATARI ABC

2)AMSTRAD 2086

Both cost around the same,and both include a 30mg hard disk.The Atari uses a 286 micro-processor however and thus seems the obvious choice.The only trouble I am having is getting info/reviews on this machine.Does anyone have/know of the machine and if so could someone please offer me advice on buying it?

All replys will be muchly appreciated,

Big Bad Dom.

dbearly@vax1.tcd.ie

****

please send me as much info on the atari ABC (if it indeed exists,as my dealer assures me!!)

again any help would be appreciated,

B.B.D.

even info on the reliability of atari machines in general would be helpful,especially their range of pc compatibles!!

2690. Anyone Seen This Game?

Newsgroup: comp.sys.atari.8bit
Date: 1989-11-06 21:14:03 UTC
From: rogerc@windsurf.WV.TEK.COM
Message-ID: <5252@orca.WV.TEK.COM>
Source record: 115443

I asked about this game here about 3 years ago and had no response. Thought I'd try again . . .

Years ago, I got a disk from a friend with a game on it that I am particularly fond of. This game was apparently pirated before it was entirely finished. I would estimate that the game is 99% complete.

The screen during loading indicates that the game is called Monty 16K (Preliminary). The game features a little guy in a Panama hat and Hawaiian shirt running through 40 or so screens and at least 9 levels. There are moving floors, firemen's poles, ladders, multi-colored locked doors and keys, swords, pulsating floors and barriers, rolling and bouncing skulls, spiders, snakes, jewels, torches and more. A really neat coordination-type game.

I would like to find out if this game was ever completed and put on the market, and, if so, who made it, where can I get it, etc.

Thanks in advance.

The name of the game is "Montezuma's Revenge". I believe it was put out
by Parker Bros.

Unfortunately, it was only about 2.5 years ago that I finally got UseNET
access... :-)

Montezuma's Revenge was available for the C64 and Atari 8-bit series. I think
I have a copy for each machine. I also seem to remember that the Atari version
started out with the "Preliminary Monty" thing.

If the game is really "Montezuma's Revenge" (I don't know for sure), it is available from B&C ComputerVisions in California for $14.95 + $5 S&H.

jrd@STONY-BROOK.SCRC.SYMBOLICS.COM (John R. Dunning) writes:
=>So has anybody been using CC65? Does it work?

I have poked around with it a bit and it is pretty good. It doesn't like floats & typedefs very much & occasionally gives strange warnings about structs, but otherwise it is pretty nice. It had no problems when I fed it an array of 256 pointers to functions & called a few of them. Anything large will require a good bit of disk space since it actually generates an assembly language program (relocatable). My MIO handles compiling fairly well. I haven't tried any bechmarks, but I will look into it as soon as I get some time. I think I have something sitting around that I used to time CC8, so I should be able to use that with a minor patch or two.

This sounds like one of the "Monty Mole" games produced by a UK company called Gremlin Graphics. I don't recognise the plot and I'm pretty sure Gremlin never released any Atari 8 bit games. The time (circa 1986) seems about right for this series of games. The ones I know of are:

Wanted ! Monty Mole
Monty Mole is Innocent
Monty's on the Run

and none of these fit your description exactly. However, they were all designed for a 48k Sinclair Spectrum - maybe they created a new game to fit into a 16 K Atari.

If this 2086 Amstrad is similar in design to their other machines, I
would say forget it. A friend of mine owns a computer store, and will
not touch any Amstrad computers. They seem to like to do non-standard
stuff with their designs, such as putting the power supply for both the
computer and monitor in the MONITOR. Of course, this means you can ONLY
use an Amstrad monitor with their computer.

Don't know about the Atari ABC. Might be a new name for the PC-3(4,5)
or something. I do know that their MS-DOS machines offer quite alot of
bang for the buck. They currently don't sell in the US though.

Message-ID: <1989Nov9.133551.27871@ux1.cso.uiuc.edu>
Source record: 115310

Speaking of CC65, has the source been made available for anonymous ftp anywhere? In the docs, the author mentions that it was derived from a cross-development system he had running under CP/M. What I'd like to do is try to get some sort of IBM PC cross development system going. I already have a cross assembler as well as a way to transfer files between the two machines, so all I need now is the C compiler. Porting CC65 into a cross compiler sounds like a fun weekend project! ;-)

From: rfc@briar.philips.com
Message-ID: <67694@philabs.Philips.Com>
Source record: 115312

I like to have a visual indication of power being on with my Atari set-up. A
somewhat annoying problem with the 850 interface is that its pilot LED is
is not in view, the way I have things arranged. (the placement of its
connectors is ackward, anyway. It's too ackward to have the sio cables running
to the front of my set-up) What I did to solve this minor problem was to plug
a LED into the current loop I/O (#4). If I remember rightly, pin 7 is tied to
+10V thru a 680ohm resistor, and pin 5 is ground. So, I wired a few LEDs in
series to these pins on a male 9 pin connector, and pluged that into #4.
Now I can see quickly if I forgot to turn the 850 off along with the other
stuff after I'm done.
(I know that this isn't going to set the Atari world on fire, but it helps
solve a minor problem.)

2709. ATASCII to ASCII

Newsgroup: comp.sys.atari.8bit
Date: 1989-11-10 00:10:27 UTC
From: rrwood@lotus.waterloo.edu
Message-ID: <18039@watdragon.waterloo.edu>
Source record: 115313

I realize that this has probably been asked before, but I'm asking again.

I have a couple of text files that I would like to print from my Unix account, but they are ATASCII files, not ASCII. Is there a utility I can use to convert them to ASCII without having to download them to my 130XE (which understands ATASCII) and upload them to the Unix account (the software for the 130XE knows how to convert ATASCII to ASCII). Obviously I could write the software myself, but then I'd have to actually think about it and spend time I can't afford.

So, in the interests of my own laziness and desire to survive this academic term, I appeal to you.

Thanks,

Roy Wood (rrwood@lotus.waterloo.edu)

=>Roy Wood (rrwood@lotus.waterloo.edu)

In the distribution of CC65 there is a set of utilities for converting files
between ASCII and ATASCII. I believe that the ATASCII -> ASCII program inserts
CR-LF pairs, so on the Unix machine you will have to remove the CR's. vi does
this nicely: ":%s/^V^M//g" You can get CC65 from terminator.cc.umich.edu. Look
for the conversion programs in ~ftp/atari/8bit/cc65/utils.arc .

Source record: 115315

Does anybody have a pin out plus other info on the 6507 CPU. This is used in the Atari interface (850?) and the old 810 disc drive (not sure about the 1050). It is a 28 pin version of the 6502 (that's about all I know about it).

I need to replace the 6507 in the interface unit, but am having no luck in finding anywhere to buy one. Suggestions for UK suppliers also welcome, though companies like Farnell & RS don't have them.

I thought I may be able to wire up a 6502 to do the job; but for this I need the pin out.

Thanks in advance

Ivan Warner.

> I need to replace the 6507 in the interface unit, but am having no
> luck in finding anywhere to buy one. Suggestions for UK suppliers also
> welcome, ...

In this country, Jameco Electronics (see most any US PC magazine for ads)
still has the 6507 at a close-out price of $2.95. Their catalog claims
that they accept foreign orders, but the combination of minimum order and
foreign postage/handling probably makes this uneconomic.

> thought I may be able to wire up a 6502 to do the job; but for this I
> need the pin out.

I believe that the 6502 and 6507 are the same chip internally, with
different signals brought out to the pins, so this ought to work. Just
tie the unused 6502 inputs high or low as appropriate.

> I'd be VERY interested to hear what the undocumented 6502 opcodes are!!!!!

A quick pass through my 6502 file didn't uncover anything. I believe these opcodes were revealed in an article in the early 1980's, perhaps in Micro, a 6502 and 6809 oriented magazine that folded by the mid-80's. As I recall, the effects of these opcodes were not too surprising if you looked at the bit patterns and matched them with defined opcodes -- they no doubt fell out of the internal logic implementation.

In the early days of cheap microprocessors, discovering such opcodes was a popular game. I think the 8085 had quite a few extensions of the 8080 instruction set that were intentionally added by Intel but, for some reason, never made part of the official spec.

The undocumented 6502 instructions were not particularly useful. See the 65c02 for a reasonably well-thought-out and much more useful set of extensions.

The 65c02 also fixed a more widely documented 6502 bug/feature. In a 6502
JMP (256*n+255)
loads the PC with contents of locations 256*n+255, 256*n. In a 65c02, it gets the contents of (256*n+255, 256*n+256).

According to the Associated Press, Atari Corp. has agreed to sell 26 of its Federated Group consumer electronics stores to Silo Inc., a U.S. electronics retailer. The agreement covers 21 Federated stores in Los Angeles and Orange counties and five in San Diego. The price was not announced. The article said Atari is still trying to sell 14 remaining stores in Texas, Kansas and Arizona. Federated had 91 stores when Atari bought the group.

Yup! I got an idea.

You are typing in your username in upper case, so UNIX thinks that your
terminal is only capable of upper case. (Remember, UNIX is case sensitive.)
So the obvious thing to do is hit the CAPS-LOCK key to go into lowercase
mode.

>I have a couple of text files that I would like to print from my Unix account,
>but they are ATASCII files, not ASCII. Is there a utility I can use to convert
>them to ASCII without having to download them to...

Why not just use tr(1). When I missed a few issues of zmag a while back,
I called a BBS, and pulled down an ARC of the missing issues. Then the fun
began, as I had to hunt down an ARC program (I have ARC5.21 sources if
anybody wants them. I added #ifdef's to handle HP-UX on the series
300, 500, and 800), and after I de-arc'ed them, I too had to convert them
from atascii to ascii. I made a very simple shell script using tr(1)
to convert the file for me. Here is is:

```
-------------------------------------------------------------------------
#!/bin/sh
#This reads in ATASCII files, and spits out unix text files.
#Stdin and stdout are used.

tr -d "[\001-\037][\200-\232][\234-\377]" |tr "\233" "\012"
-------------------------------------------------------------------------
```

Basically, what it does is remove all characters in the range 1-31, 128-154,
and 156-255. (I wanted it to remove character 0 also, but tr(1) chokes when
you try to muck with the null character). Then tr(1) converts character
155 (Atari EOL) to character 10 (unix EOL). This worked fine in converting
the zmag's.

Hope this helps.

In the distribution of CC65 there is a set of utilities for converting files
between ASCII and ATASCII.

Right. Part of the idea behind those frobs is that you can use them
equally well on the Atari, or anything else with a C compiler.

I believe that the ATASCII -> ASCII program inserts
CR-LF pairs, so on the Unix machine you will have to remove the CR's.

Right. It's Atascii to *Ascii*, not Atascii to unix. There's a
compile-time switch you can set to make it generate *nix tex, rather
than Ascii.

>Roy Wood (rrwood@lotus.waterloo.edu)

Just a couple days ago I had the same problem. Since I'm not so lazy, I
whipped out a quickie fix for the problem. The fruits of my labors appear
below, in source code form.

Just cut the source into a file with some appropriate name like "convert.c"
and type, to the shell, "cc -o ~/bin/convert convert.c"

You should then have an executable program, which acts like a filter, i.e.,
it reads ATASCII from standard input, and writes Unix ASCII to standard output.

My specific use of it was "convert <kermit65.doc | lpr"

It is, of course, rather simplistic. It just changes $9b's to $0a's.
Other ATASCII weirdities like inverse video aren't considered.

Anyway, here's the source. It's very complex, so don't try to understand
it unless you have a PhD in computer science.

>Does anyone have/know of the machine and if so could someone please
>offer me advice on buying it?

More important than the technical differences between the two machines is the difference between the companies which make the computers.

Amstrad is a professional company which produces computers. They have established a world-wide reputation for delivering good, solid computers.

Atari Corp is a toy company which has established a reputation for being poorly managed, and for its capricious treatment of its users, dealers and suppliers. While the "Atari ABC" may be the computer of the week now, you may find yourself holding an obsolete system when they go off after the next glittering gizmo and leave you with an unsupported orphan next week.

Then again, maybe they won't... it's your gamble...

As far as conversion from ATASCII to ASCII for UNIX, I have done the reverse operation. The only thing I changed was the end of line character. UNIX (at least HP-UX) uses a carriage return while ATASCII uses octal 233. I have converted files from HP-UX to ATASCII with the following simple command:

```
cat $1 | tr "\012" "\233" > $1.atr
```

This simply lists the file and translates carriage returns (octal 012) to the ATASCII end of line (octal 233). It also changes the file name by adding the ".atr" suffix.

It would be rivial to run this conversion in the opposite direction to get files to a UNIX system.

If you're not him, press 'D' now.

I keep trying to answer your mail, but it always bounces in a variety of ways; usually because it tries to go thru "telebit", which always seems to get hopelessly confused and barfs all over itself.

I asked the folks at UUNET.UU.NET if there was any way to get around this, but they weren't interested in helping.

If you can figure out some way of routing your mail thru a different path, maybe we can make some progress.

Source record: 115333

> So has anybody been using CC65? Does it work?

Yes, and yes. Here are some execution times for the sieve of
Eratosthenes running on a few of the languages available for the 8-bit
Atari, including CC65:

```
Language Jiffies Time
---------- ------- --------
Atari BASIC 186,752 51:52:32
Turbo BAS-I 72,554 20:09:14
CC8 / Ace-C 32,537 9:02:17
Turbo BAS-C 19,323 5:22:03
CC65 15,689 4:21:29
Kyan Pascal 9,418 2:36:58
```

Each run calculated 10 iterations, finding primes to 8190. Not tried
are pure machine language (I don't have the time) and Action! (I don't
have the cartridge.) Some points of interest:

1) Compiling to machine language pays off; cc65 code is about
twice as fast as cc8.
2) Kyan Pascal also compiles to machine language, but its code is
still about twice as fast as cc65.

The code for the BASICs is obviously not identical to the code for
the Cs, and due to other conciderations this is only a rough idea of
relative speed. I have found a few bugs in my version of the Turbo
BASIC Compiler: Some complex expressions evaluate to wrong results,
and certain commands just won't compile. This makes Turbo BASIC useful
for only simple programs that don't need to be compiled. While Kyan
Pascal has a nice UNIX-like command line environment, it is nicer to
have access from the SpartaDOS X environment, and I just plain prefer
to code in C. With Cc65's in-line assembly for hot-spots, it seems
a perfect development tool.

BYTE Magazine's "new" benchmarks (June 1988) are writted in Small-C
and should be interesting for comparison to other machines (yah, I
know, but it would be nice to know that fraction.)

Cc65 has some very good points:
1) A lot library calls that all have their proper UNIX-C names
(Cc65 has many more than cc8, and cc8 had a few misnamed)
2) "main(argc, argv) int argc; char **argv;" works beautifully
3) Respectable speed
but needs some things to reach metaphysical execellence:
1) Real "float"s or, at least, a floating-point library

2) scanf(), sscanf()
3) "typedef"s
4) 32-bit longs (they don't need to be fast, just available)
5) getchar(), putchar(), ungetc()
6) A Graphics/Sound/Etc... library
7) A "-Iinclude.dir" option to take "#include <..>" files from a
different directory than the default
8) How about a malloc(), realloc(), and free() that use a few
Rambo-XL banks for storage? (my ram disk could lose 16k or 32k
[B[B without causing too much grief.) The problem here is accessing the
variables in the program...

Link65.com seems to fight the SpartaDOS X Time/Date line; I turn it
off inside a batch file. I use two batch files, c1.bat:
x cc65 %1
and c2.bat:
td off
x ra65 %1.asm
x link65 -o %1.com @%1.lnk
td on
because if there are any compilation errors, SDX will run along to the
next stage and you have to wait 3 minutes to get back to your code.
Question: could SDX be made to detect any errors and abort a batch
file?

Has anyone seen the "lightspeed" C for the Atari? I think it is not
even as good as cc8, if I remember the review in Antic correctly. How
could someone sell such a thing?

2733. Re: ATASCII to ASCII

Newsgroup: comp.sys.atari.8bit
Date: 1989-11-14 14:40:23 UTC
From: frw@cbnewsc.ATT.COM
Message-ID: <4750@cbnewsc.ATT.COM>
Source record: 115337

The easiest way to convert the Atari EOL character to UNIX EOL is to upload the
the ATASCII file to your UNIX account and then use the UNIX translate command:

tr "\233" "\12" < uploaded_filename > your_choice_filename

Note that the 233 is the 'OCTAL' representation for the ATARI EOL 'DECIMAL'
155 and the 12 is the 'OCTAL' representation for the ASCII 'DECIMAL' 10.

Your_choice_filename will have the UNIX (ASCII) EOL characters.

Exchange the '12' and the '233' in the above command to convert from ASCII
(UNIX) end-of-line character to the ATASCII EOL and then download to your
ATASCII machine.

First off I'd like to thank you guys for giving me some ideas on how to downloa
d programs before, but now I have a different problem. I managed to get a copy
of Kermit65 downloaded (kermit.com and kermitnr.com). But they don't work with
my modem. The modem is a MMP1000E which plugs directly into joystick port #2, n
o interfaces need to use it, and it comes with its own software to use it (car
trige). The problem is that when I run Kermit.com the computer responds with K6
5: 850 not responding then the computer locks up. And when I run Kermitnr.c
om all it does is goes to DOS. I have also tried using some of the other emulat
ors that I managed to download from the system such as Amodem42 and vterm, whic
h are basic programs, but they call for the 850 interface. If anybody has a way
of changing the programs so that I can use them with my modem please let me kn
ow. I don't really care if they act like kermit, all I really want is a vt100 e
mulator.

> Right. It's Atascii to *Ascii*, not Atascii to unix. There's a
> compile-time switch you can set to make it generate *nix tex, rather
> than Ascii.

I believe ASCII only describes a character set, not a file format. As
far as I know, ASCII says nothing about what character (or combination
thereof) should be used as a line terminator.

Ending a line of text with a single LF (as all UNIX systems I've used
do) is as much ASCII as ending one with a CR/LF pair (like MSDOS and CPM
do). Both CR and LF are valid ASCII characters. Atari's $9b line
terminator is not.

You can reword your comment to:
> Right. It's Atascii to *MSDOS*, not Atascii to unix. There's a
> compile-time switch you can set to make it generate *nix tex, rather
> than MSDOS text.

> buy one. They are junk.

Whew... I've been learning a lot about the way Amstrad is perceived in the U.K. and Europe...

Here in the U.S., Amstrad computers seem to be among the "second line" of third-party machines, along with names like Blue Chip and Packard Bell... we don't have Amstrad stereos and other things.

Since the original question came from the U.K., I'll have to defer to the experience of those in that marketplace... I think my point was clear though, even if the comparison with Amstrad was flawed...

Well, to use Kermit65 you have to be able to control the modem through
the data stream. In other words, you can't rely on XIO commands & such.
Most commonly used for this purpose is the Hayes command set. I have seen
a handler for the 1030/XM301 to emulate a subset of the Hayes command set,
but never anything for the MPP modems. Until something like that turns up for
the MPP, it would be difficult to get it to work with most terminal programs
unless they have MPP support built in.

> how extensively they are using their 'toys'.

Yes. But Atari *is* still considered being a 'toy' company.
And sure they do act like one. I know people who have bought equipment
for professional DTP for about $20000-$25000 and not getting support!
(TBV Orebro).
The first machine they got was broken - it took Atari OVER A MONTH
to replace it!
Then, when they finally got the machines - one of the harddisks and
the laser was broken.
They got the laser quite soon after a few, nasty, telephone calls to
Atari Scandinavia.

When I last spoke to them (about a month ago), they were still waiting
for the harddisk. After FOUR MONTHS. "We have got no harddisk", Atari
says. They sent proof to them. Atari still claims they haven't received
any defect harddisk.

Is this the golden way of treating customers? Do you think they
will recommend Atari to someone else? I can tell, they're even talking
about selling the stuff and buy some Mac's - just to get the support and
a friendly smile from the salesman!

2741. Avatex 1200hc driver and BobTerm

Newsgroup: comp.sys.atari.8bit
Date: 1989-11-15 23:18:07 UTC
From: krieg@jupiter.uucp
Message-ID: <1428@mrsvr.UUCP>
Source record: 115345
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I recently upgraded my ST sytem to 2400 baud, and moved my 1200hc to my 130XE. I had previously used Kevin Ledbetter's term program for the XM301 (I used that term program for years, and now I can't remember the name of it). I wanted to use his program for the 850 and P:R: connectors, but I couldn't get it to work. The software was included in my P:R: connector's box, but it wouldn't go. I also tried BobTerm (which everyone tells me is the best) but it also would not work. I have managed to get DeTerm to work. The Ledbetter program has a built in driver, so I don't know how I can get that one to work. I have tried using the driver that works for DeTerm on BobTerm, but the system does bizarre things after the dialing is finished. I have yet to make a connection with it.

Do I need a special driver? Anyone know why Ledbetter's program (Ah, now I remember, 850 Express) doesn't work with the 1200hc? Could someone e-mail me the driver they use for BobTerm? Once again, the system I am using:
* Atari 130XE computer
* P:R: Connector interface
* Avatex 1200hc modem

DeTerm works OK, but I'd like to see if BobTerm or 850 Express are better. Thanks.

From: <AMONSON%IDCSVAX.BITNET@CUNYVM.CUNY.EDU>

> So has anybody been using CC65? Does it work?

Yes, and yes.

Great!
Here are some execution times for the sieve of
Eratosthenes running on a few of the languages available for the 8-bit
Atari, including CC65:

Language Jiffies Time
---------- ------- --------
Atari BASIC 186,752 51:52:32
Turbo BAS-I 72,554 20:09:14
CC8 / Ace-C 32,537 9:02:17
Turbo BAS-C 19,323 5:22:03
CC65 15,689 4:21:29
Kyan Pascal 9,418 2:36:58

That's pretty good. I never got around to doing benchmarks like that.
[...]
Some points of interest:

1) Compiling to machine language pays off; cc65 code is about
twice as fast as cc8.

Right. In fact, if you look at the generated code, it's pretty bad. It
ought to be possible to get another factor of two or so by teaching the
compiler to have a little more knowledge about expression context.

2) Kyan Pascal also compiles to machine language, but its code is
still about twice as fast as cc65.

Kyan Pascal is probably tuned for the Atari/6502. CC65 is essentially
Small-C, so it uses generic operations for a lot of things that could be
done slicker.
[...]
BYTE Magazine's "new" benchmarks (June 1988) are writted in Small-C
and should be interesting for comparison to other machines (yah, I
know, but it would be nice to know that fraction.)

Yes. If you've got them in machine-readable form, please post them,
I'll stick them in with CC65.

Cc65 has some very good points:
1) A lot library calls that all have their proper UNIX-C names

(Cc65 has many more than cc8, and cc8 had a few misnamed)

More the the point, all the source and tools are available, so if there are ones I didn't put in that you want, they're trivial to add. If I got some wrong, they're trivial to fix.

2) "main(argc, argv) int argc; char **argv;" works beautifully
3) Respectable speed
but needs some things to reach metaphysical execellence:
1) Real "float"s or, at least, a floating-point library

I've thought about adding floats, but decided to post what I had first. In principle, they're not hard to add, but would bloat the compiler some, and space is pretty tight there already.

2) scanf(), sscanf()

That should be easy to write.

3) "typedef"s
4) 32-bit longs (they don't need to be fast, just available)

Same thing as applies to floats. In principle, it's not too terrible, but it's hard to know how to do it without taking too much space.

I've found that I don't usually need stuff like that on the Atari, and when I do, it's usually something I can just whack up in assembly language. It would be nice to have the compiler know about it though.

5) getchar(), putchar(),

Those are trivial to write.
ungetc()

... and that's not to terrible; it would require fopen returning a structure instead of the IOCB. Shouldn't be a big deal.

6) A Graphics/Sound/Etc... library

I was able to get many of the sample programs (like pmdemo.c) that came with CC8 to work, though some required a bit of hacking, as they were assuming all kinds of things about the CC8 runtime environment. If anyone comes up with anything useful, please post it.

7) A "-Iinclude.dir" option to take "#include <..>" files from a different directory than the default

Ok, I'll see about adding that.

8) How about a malloc(), realloc(), and free() that use a few Rambo-XL banks for storage? (my ram disk could lose 16k or 32k [B[B without causing too much grief.) The problem here is accessing the variables in the program...

That'd be nice, but I think it'd be hard. How would you be able to tell the difference between pointers that lived in directly addressabel

memory and pointers that had to have base registers frobbed when you dereference them?

Link65.com seems to fight the SpartaDOS X Time/Date line; I turn it off inside a batch file.

Humph. I believe it works for me. What sort of lossage do you see?

I use two batch files, c1.bat:
x cc65 %1
and c2.bat:
td off
x ra65 %1.asm
x link65 -o %1.com @%1.lnk
td on
because if there are any compilation errors, SDX will run along to the next stage and you have to wait 3 minutes to get back to your code. Question: could SDX be made to detect any errors and abort a batch file?

I don't know, but if anyone does, could they post the answer? I'll build it into exit().

When using the 850 interface or P:R Connection, delete the file called
RS232.COM from your BobTerm disk.

The program has many different drivers for different modems. You choose
the driver you need and rename it RS232.COM. That way, you can use
BobTerm with any modem on the face of the planet. However, both the 850
and P:R have drivers in ROM. By removing the RS232.COM file, it tells
the program you have such an interface, and gets the handler from it.

If you have any more trouble, let me know and I'll tell Bob Puff (he
lives down the road from me).

I've still got the following items for sale:

I still have about 15 Atari 850 interfaces for sale. Includes power supply and documentation (written by myself). Price is $40 plus $5 shipping.

Zenith 5.25 inch disk drive for the ST. It's brand new, includes a data cable (built in) and a built-in power supply. I got a few of these from a friend of mine (he owns a computer store). Also included is a disk containing the needed drive access-time program and a formatting program. If you have PC DITTO, you need a 5.25 inch drive! The drive is only $140 plus $10 shipping.

If interested, contact me through one of the below routes.

I don't know much about it, but I believe it would be roughly similar to
a 1050 with a US Doubler installed. It should work with most DOSes, but
SpartaDOS X is the only DOS I know of that lets you use the high speed mode.

The Indus GT is compatible with Atari Dos and Sparta Dos, with Sparta Dos you'll get full double density, e.g. like what you would get with the 1050 with the US doubler, Its a nice disk drive but the original company went out of business a couple of years ago, however I believe future systems may still sell/or manufacture them

An Indus GT is definately compatible with most Atari DOS's. It has single
density, (720 128 byte sectors), true double density (720 256 byte sectors),
and 1050 mode (1023 128 byte sectors). When shipped from the "manufacturer",
it has it's own DOS, which is not very good -- it's LARGE and not much better
than DOS 2.5.

Is C65 public domain?

[I'm assuming you mean CC65]

CC65 is *NOT* public domain. It *IS* freely copyable, which is what you're probably really interested in. So what's the difference? Stuff that's in the public domain may be used for any purpose by anyone. I didn't want CC65 and the related tools to fall into the hands of someone who would attempt to charge money for them, or someone who would modify them and then not make the modified sources available. Therefore, the terms of distribution are that anyone may copy it and modify it, but must make the modified copies available, with sources, for free. Ie, do what you want with it, but don't attempt to take away anyone else's right to do what they want with it.

If so, is it available via ftp?

Yes. Unfortunately, I haven't gotten the compiler sources cleaned up yet (I had a hack attack and started fixing bugs) but they should be appearing shortly. All the other sources, and all the executables, are there.
3rdly,
could some post a list of ftp sites?

The only one I know of that has it is terminator.cc.umich.edu.

2755. Atari 800 Monitor Connection

Looking at the port itself, you will see:

```
U
3 1

5 4

2
```

Pin 1: Composite Luminance (not connected)
Pin 2: Ground
Pin 3: Audio Out
Pin 4: Compoite video
Pin 5: Composite Chroma (nc)

One goofy thing I found was that with a mono monitor, the screen looks messed up, like every other pixel was skipped. I found that by connecting the composite video to either Pin 1 or 5 (I can't remember which), it cleared it up. I don't know if that happens on the XL/XE, but it did on my 800.

I have 2 Indus GT's. They are much better than 1050's. They work with all software. I have used SpartaDos, Dos II, Dos 2.5, Dos III, SmartDos, MyDos, Dos-XL, you name it, i've used it or seen it used on an indus. They offer true double density, higher speed than 1050's, nice track readout, push-button write protect, high-speed "synchromesh" mode from dos-xl, a whole bunch of other stuff. I don't know if they are still available, I don't keep up-to-date on the 8-bit world anymore...

hi

I'm for The u of ky and was wondering if anyone could help me with a
problem i am hving with the 8-bit files on the terminator. I do everything
as it is supposed to be done. Set type to binary, GET fname, and kermit
it down from our primes to my 8-bit. The probalem is is that when i go
to unarc these (with superunarc 2.3) it says file not arc format?!?!
I changed my kermit type to binary, and everything, so can anyone help me
with the painful probalem. As of now, nothing is usable. Any assistance
would be GREATLY appreciated. Thanks.

Jon W. Backstrom asks:
>I just bought an old Atari 800 on a lark and I wanted to hook it up to
>my Commodore monitor.

>Could some kind person mail me the pin-outs for the Monitor port?

Yer probably not going to believe this Jon.. (I didn't myself, at first)
but the Atari monitor port has exactly the same pinouts as the C-64
does..!

The poor engineers who actually designed them to be compatible this way
were probably fired from their respective companies long ago, but we
can still thank them...

Source record: 115266

Hmmmm.....
A funny thing happened to me the other day....

I sent my 130XE to Atari with $65 so they would replace it, right?
Well, I accidentally sent them my monitor cable, too. Three weeks later (no
complaint here--the check had to clear) the new XE arrived, but the cable
was nowhere to be found. SO, I trekked on over to Radio Shack, bought a
5-pin DIN male plug and two RCA audio plugs with exposed end wires.

With the help of ANTIC's tech tips, here's which wires go where:

```
__ __
/ +-+ \
3 |o o| 1
5 | o o | 4
\ o /
-----
```

2 VIEW: Looking into computer from outside!
PIN #
1. Composite Luminance: Attach the Negative (-, Ground) wire of the Video cord
2. Ground: Attach the Negative (-, Ground) wire of the Audio cord
3. Audio Output: Attach the Positive (+) wire of the Audio cord
4. Composite Video: Attach the Positive (+) wire of the Video cord
5. Composite Chroma: Unused (sadly)
NOTE: I believe there was an article in ANTIC which explained that the
Chroma pin was used in the 800, but abandoned in the XL/XE versions,
although it is capable of being used with modifications. I'm still
looking for the article....

>BobR

I've heard this, but maybe this applies to a different Commodore system.
I have a C-64 (the old brownish-grey model) with a 1702 monitor. The
cable in the back which connects to the audio/chroma/luminance RCA plugs
is an *8* pin plug...seven around the bottom with one in the middle.

This won't plug into the Atari 800 5-pin socket, of course. :-)

Was this changed in the C128 or later models? (Here I sit with a collection
of the worlds first 8-bit systems, but I don't know what has happened since.)

On another note...anyone want to e-mail me to start a conversation? Now
that I have an Atari 800 with 2 disk drives, I'd like to see how I can
start to make it go (i.e. what software do I need to decode CC65, etc.)

Thanks for all your help!

Cross-posted to: comp.sys.atari.8bit,misc.forsale

How-dee all! The following is for sale either individually, or at a
reduced price when bought in tandem:

Atari 1050 disk drive. No fancy upgrades or anything of the sort. Just
a plain, simple 1050. Excellent condition. $80

Atari 800, 48k, GTIA chip, Basic cart. Also in excellent condition.
$35

And the 850 interfaces I've had for the past few months. $40.

Now for the groups:

1050 & 800 for $110 (save $5)
1050/800/850 for $145 (save $10) <- includes free 850 - modem cable

If interested, please leave me a message at any of the addresses below,
or call voice at (716)328-1703 at any reasonable time EST.

The Indus is all this and more. I remember sssing CPM compatibility
through the Indus GT with an on board chip you could buy. Drive looked
great and was supposedly built really well. Some other third party drives
that came out were the Rana, Trac, Indus GT. The best drive I ever saw
(as far as speed and copying capability and features) is a 1050 with a
Happy Enhancement. That drive copied anything and wrote/read faster than
the US doubler in fast mode.

> MAC-65 owner's manual?

No. The 6502C is a 6502 that is slightly customized electrically to
Atari's specs. I think the ones I've seen were manufactured by Rockwell.
The customization integrated a little glue logic that was found on the
original 400 and 800. It's been a while, but I think the clock generation
was changed and tristate buffers for the address lines were integrated.
The 6502C was supposedly used in late 800 production (with a simplified
CPU board) and in subsequent Atari 8-bitters.

The 6502C is instruction-set identical with the 6502 but *not*
pin-compatible. The 65C02 is pin-compatible with the 6502 (hence not with
the 6502C) but has a number of useful extensions to the instruction set.
I think the 6502C is NMOS; the 65C02 is CMOS.

To add further to the confusion,

(1) The 6502A and 6502B *are* just 6502s that are guaranteed to run at
higher clock speeds. The original 800 used a 6502B, also clocked at
1.79MHz.

(2) There are at least two different versions of the 65C02, one identified
with NCR (or Western Design Center) and one identified with Rockwell;
the extensions are somewhat different.

Hope this helps. I have more info in my files at home if anyone really
cares.

2768. NEED ATARI-RELATED DOCS

Newsgroup: comp.sys.atari.8bit
Date: 1989-11-21 18:27:37 UTC
From: rvp@cbnewsh.ATT.COM
Message-ID: <5991@cbnewsh.ATT.COM>
Source record: 115272

My current goal is to acquire Atari Game-Writing and general
documentation.

I'd be interested in getting De Re Atari, a Dos II Reference Manual,
miscellaneous "COMPUTE!" and or/other similar books that address
just about anything Atari. My foci of interest include info about
eprom burning, economical cartridge production, tutorial documents
with nice illustrations and sample asm source about game-related
techniques, etc.

I already have the Atari OS and Hardware reference manuals and sufficient
documents on assembly language itself.

I have already decided on a Pseudo-Sam Cross Assembler that runs
on by PC compatible, and am successfully uploading binary to my
Atari over the 850 interface, for decent edit-compile-run turn-around
(as my binary is always <8K, for small cartdridge development) times.
This is only about 2 minutes for a full 8K binary.

Please email me about any docs and suggested prices you wish for them,
with perhaps some comments. If there is interest, I will post your
mini-reviews on these documents (or send me a mini-review even if you
do not want to sell your document).

Thanks!
Rob Phillips homxc!rvp 201-949-0271

>...Was this changed in the C128 or later models?
Well, there was a change, but not in the direction you're thinking.
The C64 first came with a the five-pin plug which was compatible with
the Atari. This provided composite video and audio, along with a ground or
two. They later introduced a different version which had separated chroma
and luminance pins, for better video on monochrome and (their) colour monitors.
(It really helped, too.). This was the eight-pin plug.
I had both models; my original C64 got hit by a lightning-based power
surge, and the one I got back in the swap (Commodore once had the same
"repair" policy that Atari has now) had the eight-pin. Fortunately, I could
plug my old five-pin cable into it just fine...
The C128 also has the eight-pin plug for 40-column output. (I'm still
using my original cable, one I made up from my spare TRS-80 Cassette Cable.
If you're trying to build a monitor cable and need that silly plug, just go
to Radio Shack. I _think_ you can still buy the thing.)

It's also possible to get double density with Dos 2.0, although you must use
another Dos (or have 2 drives) to convert between densities (Dos 2.0 does not
support single-drive conversions.)

As all the Atari mags (Analog, Antic) are folding, such a list would be a good
idea. However, I'm not sure whether it would be considered advertising (for
net access purposes), and therefore non-postable. I WOULD be interested in
receiving such a list.

>it has it's own DOS, which is not very good -- it's LARGE and not much better
>than DOS 2.5.

I disagree completely! DOSXL is a hundred times better than DOS 2.5 and
compares favorably to SpartaDOS. It doesn't take too much more memory, and
has a resident command line interface, which is always nice. It is 100% DOS
2.0 compatable and has an optional menu driven interface if so desired.
(It also can be made resident...uses memory though - perhaps this is why you
thought it used a lot of memory?)

From the point of view of an Atari 800 user, this DOS is a real godsend; I
suppose if you have an XL or XE, SpartaDOS would probably make much more sense
though...

No, the 6502C is a chip with slightly different pin functions. Atari just wasn't smart enough to realize that the 65c02 (or even better, the 65802) would be a vast improvement.

> MAC-65 owner's manual?

Nope, the 6502C has exactly the same instruction set (with it own funny
idiosyncrasies) as the original 6502. It does have some (one?) extra
pins defined to easily support the Antic chip -- I believe this is to
synchronize passing off control of the address bus between the two chips.

On the old 800 (which used a real 6502), the function was handled by some
discrete gates and buffers -- so you could swap out the 6502 with a 65C02.
No work with the 130XE (fie!)

Jon Backstrom mentioned, concerning the monitor connector on C-64s...

>I have a C-64 (the old brownish-grey model) with a 1702 monitor. The
>cable in the back which connects to the audio/chroma/luminance RCA plugs
>is an *8* pin plug...seven around the bottom with one in the middle.

Argh.. I thought about this after I'd posted my reply to the earlier question... my C-64 is one of the very first (..like, $500) models.. the monitor connector on it is the same 5-pin DIN connector that my 800 used... but I remembered (too late) that they changed the connector in later versions. Unfortunately I don't have the pinouts for the 8-pin DIN connector.

(Incidentally, one interesting side-effect of changing the plug was that it's now possible to plug in the 7-pin DIN *power supply* connector into the monitor socket on the back of the computer... with the kind of fireworks you might expect from something like that..! :)

If you're in Ohio, I'd say check in the Dayton area. I attended the 1988 HamVention at the Hara Arena down there, and there was a group handing out flyers for someplace that sounded like they had EVERYTHING ever made for the Atari, available mail-order.

Anybody else get there, see this flyer, and have it handy? If I find it I'll post the company name/address here... hopefully they're even still in the business...!

"There is no such thing as a stupid question," particularly here. Ask away!

> 1)Being new to UNIX, I have just come to see the value of being able to
> emulate one of the more common terminal types. How do I do this?

You're in luck; when I first got into using the Atari 8-bits, there was next to nothing of the kind -- today, there are several very good terminal programs which emulate VT100 and other terminals. Some folks recommend "OmniCom," some recommend "Kermit65". I'm the latter... OmniCom offers several file-transfer protocols as well as a fair VT100 emulator; Kermit65 offers -- obviously -- Kermit file-transfer and, IMHO, the *best* VT100 emulation on the Atari 8bit.

> 2)In connection with the above quesiton, is there any reasonable way to
> emulate an 80-column screen?

Several, in fact. 1) Use a graphics-0 (text mode) screen with horizontal scrolling; 2) Use a narrow text font and bitmap it onto the graphics-8 screen! OmniCom uses exclusively the latter; Kermit65 lets you choose between the two; other programs, who knows? :-) There also exists the Atari XEP80, which generates TRUE 80-column text, but I believe requires special driver and other software modifications...

Judging from the software you're using and the responses, you probably need to find a handler for the modem which will list it as "R:" and have at least a limited ability to respond to XIO commands to the "R:" device properly. The handler should be loaded before you load Kermit (probably a better idea to use kermitnr.com. It doesn't try to load a handler which you already installed.), or the handler could be prepended to the kermit prog. (I haven't actually tried this, so there may be other factors involved, but that's basically the theory). As for Amodem, try a higher version, like 7.x, which has a handler for MMP modems. That should be available on Atari BBS's (has been for quite a while).

Since the original poster has a Commodore monitor, there's a good chance that the luminance and chroma outputs can be used. On my 1702, I connected the audio, luminance, and chroma to the corresponding RCA jacks on the back of the monitor (ground to all the shields) and ignored the composite video. The picture is sharper, especially with things like 80-column terminal emulators, and the colors seem better too.

2790. light guns

Newsgroup: comp.sys.atari.8bit
Date: 1989-11-25 22:19:09 UTC
From: wilmott@topaz.rutgers.edu
Message-ID: <Nov.25.17.19.07.1989.7650@topaz.rutgers.edu>
Source record: 115294

About a year ago I bought the Atari light gun, both for playing the light gun XEGS carts, and for tinkering around with. While the Atari gun is basically functional, it's not too accurate or sensitive...you have to be close to the tv for it to work at all well. This problem was mentioned here last year and someone posted a modification to the (Nintendo? Sega?) light gun to make it compatible with the Atari machines, and it was supposedly much more accurate than the Atari gun.

Anyway, on to my question. The past 2 months I've seen ads for an Atari compatible light gun from Best (see the December Analog San Jose Computer ad). Has anyone used this light gun? Is it more accurate and sensitive than the Atari?

Actually, you HAVE to prepend the R: handler to KERMITNR.COM. At
least, I had to.... If you use the DOS C command, with the argument
AUTORUN.SYS,KERMITNR.COM/A (where AUTORUN is the R: driver supplied by
MPP), you will get a file which works.

I was planning on buying a light gun for my computer, and since I'm not a big fan of Atari computer accessories, I decided that the Best light gun would be the better purchase. But I already have a Nintendo game system with a light gun, so I was wondering if anyone had the modification plans to make this gun compatible with my Atari 800. Also, any information on how the light gun is handled by the operating system would be appreciated (I know a good deal about the internals of the Atari computers, so any extremely technical information will not intimidate me too much). Thanks.

I have connected the Atari computer to my Sony trinitron via
the Atari switch box. I have connected the antenna wire to
the 300 ohm on the switch box and use a VHF antenna adapter
to connect to the vhf on the TV. My channel on both the computer
and the TV are set to 3.

Everything works great with the computer when the switch box
is set to game. But when we want to watch TV programs and
set the switch box to TV, the picture is too fuzzy. I have
to disconnect all the wires and switch box to be able to use
the TV for viewing.

Has anybody had this problem? The TV is just a portable and
not hooked up to an outside antenna.

Thanks,
Diane

Those switch boxes contain splitters to keep the impedances right.
One undesireable effect of splitters is they attenuate the signal.
I have a TV that requires a stronger signal than many, plus I live
on the fringe area of the Boston TV range, and have seen that effect.
You could try an antenna amplifier between the antenna and the switch
box; I didn't need to, as cable TV moved in shortly after. Antenna
amps can probably be had for $10 or $20, and I'd try Rat Shack.

If you try it, would you mind posting your results? I for one would
like to know.

I agree that Analog should have published some sort of info regarding
their demise, as from the information I've read they knew when the November
issue came out. In addition, The old Analog may have been hurting for
advertisements, but in the combined Analog/Stlog the ads were plentiful.
Who knows, Maybe they're reconsidering not stopping publication. But
there are confirmations on Delphi (as of a couple weeks ago) stating that
the December issue would be the final Analog.

2804. Need Printer Repair (or replacement) Info

Newsgroup: comp.sys.atari.8bit
Date: 1989-11-29 03:22:15 UTC
From: jmb@cbnews.ATT.COM
Message-ID: <11790@cbnews.ATT.COM>
Source record: 115208

Does anyone know where I can get a 2 year old Atari XDM121
Daisy-wheel printer repaired? Any chance of finding a place in
the Central Ohio area?

The symptoms are that last night it just started spewing out garbage
even when doing the self-test. It almost looks like it is printing
half of a character.

If it is not repairable, what are my options in printers for the
Atart 800 running AtariWriter? I do not have an 850 interface,
but am willing to add one if it helps.

Thanks for any and all help.

I also have the above mentioned problem with the TV and the switch box. My television is a 13 inch color, and I get one hell of a fuzzy picture when I hook my cable line through the switch box.. I also get a fuzzy picture when I have the switch box set to game though. Is there any way to fix this?

> Are you SURE Analog is going under? If they knew about it a month or two
> in advance, couldn't they at least publish an editorial in December's issue,
> take out the subscription cards, and purge the parts that say "Authors:..."
> You know what I mean?

Analog and STLog are gone. For sure.

The December issue of Analog would have been laid up in late September, articles and editorials should have been finalized by early to mid September. That was the typical lead time when I wrote stuff for STLog. (Article lead times are sometimes much longer, STLog sat on one of Dave and my articles for 18 months before it ran.) In September LFP still planned to continue publishing Analog/STLog so why would they announce the folding then?

Magazines rarely announce they are ceasing publication, simply because they can't. By the time they know it there is no way to include it in the final issue. (Look at what happened to PC-Tech Journal last spring, the last issue had a list of articles that would be in the next issue.)

Sounds to me like a problem that I had before with my 1027 printer. On
the 1027, the strike plate moves in conjuction with the print head. The
problem was that the rail that the strike plate slides back and forth on
needed to be lubed. I spent a fair amount of time fiddling around with
the print head before I realized what was going wrong. I don't know if
the theory of operation is the same for your printer but before you have
somebody else charge you for a lube job, you might want to try cleaning
and re-lubing the rails with a silicone grease.
I first used WD-40 on a cotton swab to clean them then I cleaned off the
WD-40 with alcohol on a swab. I dried the rails with another swab before
I applied the grease. I THINK the silicone grease is important because
it doesn't collect dust like oils do.
Hope this helps out...

```
Charles Green (or any interested parties; I couldn't reach your address),

This is the C code that I used for my sieve speed test on the cc65 compiler.
From what I know about Action!, the conversion should be fairly simple. The
code may look familiar, I think it originated from the cc8 distribution...

o /
---- X ---- Cut Here ------------------------------------------------------------
O \

#define TRUE 1
#define FALSE 0
#define SIZE 8190

char flags[SIZE+1];

char start[3], stop[3];

main ()
{
int i, prime, k, count, iter, total;

printf("10 iterations\n");
total = 0;

for (iter=1; iter<=10; iter++)
{
printf("iter %d\n", iter);

gtime(start);

count = 0;

for (i=0; i<=SIZE; i++)
flags[i] = TRUE;

for (i=0; i<=SIZE; i++)
{
if (flags[i])
{
prime = i+i+3;
for (k=i+prime; k<=SIZE; k+=prime)
flags[k] = FALSE;
count++;
}
}

gtime(stop);
```

```
printf("Start: %x, %x, %x\n",
(int)start[2],
(int)start[1],
(int)start[0]);
printf(" Stop: %x, %x, %x\n",
(int)stop[2],
(int)stop[1],
(int)stop[0]);
}

printf("\gDone!\g\n");
}

gtime (time)
char *time;
{
time[0] = *((char *) 0x12);
time[1] = *((char *) 0x13);
time[2] = *((char *) 0x14);
}

o /
---- X ---- Cut Here ------------------------------------------------------------
O \
```

I have used the curly braces instead of "$(" and "$)" (I use textpro with a TEXTPRO.FNT file defining the characters.) I don't know what the Action! editor will do with these. I calculated the running time by hand using a hex calculator. The gtime() function should have been in pure 6502 code with interupts shut off. I didn't check what this code compiles to, but it may be slow enough to get a bad reading from the jiffy clock rolling over midway through. In my 10 iterations I never had obvious bad data, so I left it.

Have Fun! It will be interesting to see the results.

I've been a big Alternate Reality fan over the years, and have come across several "cheat" or "edit" programs on BBS' as well. I've found programs that let you edit a City character's stats; unlock the hidden area SE of the Arena in the City to get to more guilds; let you edit a Dungeon characters stats; let you transport to locked areas of the Dungeon (outside level boundries, into the arena & palace, into the Chapel sanctuary (VERY useful), etc.). What I HAVEN'T seen yet is a program to let you transport a *city* character to any location (outside city boundries, into the palace/arena, etc.). Does anyone know of such a beast; or at least have a description of how a city character is saved on disk so I might be able to make one???

I got "Alf And The Color Caves" for my 5 year old son and he loves it.

You might also look at "Linking Logic" and "Memory Manor" from
Fisher-Price. If I remember correctly, these are recommended for 5 to
8 year olds. Not really pre-school, but very helpful in developing
memory and logic skills.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <24622@cup.portal.com>
Source record: 115221

Another thing about the TV "switchboxes" is that they're notorious for poor quality components. It's possible that the problem Dianne was having is similar to one I had, where the wire from the 300 Ohm connection had pulled loose from the switch somehow. Also, the switches themselves aren't usually all that good. It might be a good idea to try another one (again, from Radio Shack) and see if it helps any. They're fairly cheap...

Boy, the number of postings to this group really drops off once exams hit, doesn't it?

Anyway, my question is whether anyone has seen the graphic user interface for the 8-bits. I think that the product I'm thinking of is called "Diamond Dos" or something. If anyone has seen this (or anything similar) in action, what was your impression? I suspect it would be pretty bad, and the thought of using a joystick in place of a mouse makes me cringe. It would be nice to have a Macintosh-like interface for the 8-bit, but I don't think the machine is fast enough to make it anything but painful to see.

And while I think of it, has anyone tried to hook-up a mouse to their 8-bit? I don't suppose it would be that hard, though you'd then have to write all your own software to take advantage of it. That might make a good project...hmm. Does anyone know where I can get a cheap mouse with basic technical specs? I guess I could always go for a Mac mouse, though Apple overcharges sooo much for their stuff.

TXTPRO40.FIX - December 4th 1989

Feel free to distribute this fix via modem, newsletter, etc but please don't alter it. If this is distributed via newsletter, I sure would appreciate a copy.

Well, Ronnie Riche has come out with yet another version of Textpro, but he only fixed the problem with the parameter commands. Since I have his address now, I'll inform him of the other problems. :)

Anyway, this is the new fix file for Textpro Plus 4.0x. It is updated, and has only a BASIC program to make things easier on me. Since Textpro Plus 4.0X is for all DOSes and machines I don't need to make different fix files and you don't have to wait for my newest fix.

The fixes incorporated into this file:

Problem with the parameter commands:
The new version of Textpro fixes the problem that occured with the parameter commands by changing the slash to a comma. This should work with almost every Atari DOS because the comma is recognized as a filename terminator (the reason for this is because RENAME requires two filenames, and uses a comma as a filename terminator). However, the EOL (RETURN, Decimal 155, Hex $9B) is the universal terminator (for Atari 8-bits) and should be used as such. This fix patches Textpro so that before sending a filename to DOS it changes the comma (or slash, or whatever you decide to change it to) to an EOL, then when DOS returns to Textpro, it changes it back. In Textpro Plus 4.0x you can change the slash character to one of your own choosing but changing it to an EOL makes Select-L,l and P print a return to the screen (instead of the left arrow).

Lockup problem on reset:
I had this problem for the longest time but never managed to figure out what was happening. Anyway, the new version apparently fixed this and hitting RESET works perfectly.
SDX+MIO USERS: You have a slight bonus when using Textpro Plus. If you need to reconfigure your MIO you can do it from Textpro and upon hitting RESET you'll be returned to Textpro. If you try to reconfigure the MIO from the SDX command line the SDX will cold start when you return from the MIO.

Enable/Disable screen keys:
This fix patches the Select-Control-Z and Select-Control-X functions. X turned the screen off, and Z turned it back on. I felt this was a waste and not in the spirit of Textpro's other commands that toggle states (CAPS, INVERSE, Ctrl-A, etc) so now both Z and X toggle the screen display. Perhaps later the Z can be used for something else.

Function keys:
This fix is for all the nuts out there (myself included) who have managed to restore the function keys to their XL/XE computers. The 4 function keys appeared briefly on the 1200xl computer and then disappeared from future machines. They act as the arrow keys but control does not have to be held down. They have a few other functions, but those are useless in Textpro. The code to support these function keys did not disappear and still exists in working order in the new roms.
That's the good news...now the bad, Textpro (any version) does not recognize these function keys. This is not good, I restored my function keys because I wanted to be able to use them as arrow keys without holding down the control key at the same time. This fix will make the function keys work with Textpro Plus 4.0x but NOT with any other version of Textpro. Just as a teaser...do you know that you can add 6 more function keys to your wonderful 8-bit Atari? I'll get around to telling you how this is done about the same time as the first revision of Textpro 4.0X comes out. :)

Find function:
This has been sped up but unless you do a LOT of macro finds and/or global replaces you'll never notice the difference. The most time consuming part of finds/global replaces is the screen movement. Soon as I figure out how it works, I'll make a patch to have the screen jump right to the new cursor position rather than scroll through the entire buffer.

Keyboard Commands:
The keys modified by this fix are listed at the end of this file. A complete summary of Textpro Plus 4.0X commands will be made available soon.

Since the authors of Textpro do not want it distributed in modified form, you should load this fix everytime you load up Textpro to prevent a modified copy from being distributed accidentally. To load the fix from within Textpro, just hold down the select key and press control-W. The command line will show 'Binary Load>D:' and you just need to type in TP40FIX.OBJ and hit return. The screen will return to the standard blue and the normal atari character set. To fix this just type CTRL-M. That's all there is to it. If you prefer not to load the fix in everytime you use Textpro, you can append the fix to the Textpro file and it will be there everytime you use that version. Again, please don't distribute your "new" version.

2826. tv switch box in Europe

Newsgroup: comp.sys.atari.8bit

From: bernard@cory.Berkeley.EDU
Message-ID: <20337@pasteur.Berkeley.EDU>
Source record: 115230

Hi,

I want to take an Atari to Europe, and would like to know if I
could set them up to European-style tvs.

Can I use the regular tv switch box, or do I have to buy something
else that will make it compatibile with the PAL system that they
use over in Europe.

Also, would it be ok if I just hook up the Atari to a standard
electrical adaptor?

Thanks,
Dave

bernard@cory.Berkeley.EDU

Maybe I've been out of touch with Atari 8bit reality lately, but isn't a 130XE worth much more than $75, especially considering it would be in PERFECT working condition?.....makes me dread to even consider the monetary value of my 1200XL.

If you're using a command-driven DOS like DOS XL or (maybe) Spartados it is
not necessary to combine the two (though in the end, it will probably be a
better idea).

I am writing this in the hope that some kind soul will help me out. My problem is with the game Alternate Reality ,The City. I have an original copy which loads and executes with no problem. The problem occurs when I actually play the game. I can walk around the city with no problem, but when I try to enter any building the data disk does not load. This means that the game is totally unplayable. I was wondering if anyone on the new would be so kind as to help me out. Please post a message if you can help me. I would really like to be able to play the game.

Roy Wood asks about the Graphics environment programs for the 8-bit Atari..

I've used the Diamond O.S. cartridge a bit, and it's actually not bad
at all... in fact, if it had been available for the 8-bit system a few
years ago, it might have gone a long way toward generating a lot of
new interest in the machines.\

Rather than "Mac-like" it's more "ST-like"... it's obviously been modelled
after the GEM interface in the ST...

While you _can_ use a joystick with it, it works best of all with a real
ST mouse.. (there's also a KoalaPad driver for it, but I never tried
using that). With a true proportional mouse like the ST's, you can
do true "point and shoot" operations.

All the "Mac-like" operations are there, including windows, dragging icons
to copy disks and files, slider bars on the windows... things like that..

There are even "Desk Accessories" that can be called up from within other
programs..!

The cartridge came with docs showing how to program the "GEM-like" features
into your own programs... a few minutes with the docs, and I was opening
windows with title bars and icons from Atari BASIC... very nice..!

There was another Graphics interface cartridge that was being worked on
called "GOE" (Graphics Operating Environment), but it seems to have
evaporated into the great vapor cloud in the sky... actually, I liked
the demo version I played with better than the Diamond O.S. in many areas.

Like I said, if these things had come out a few years ago, things might
be different in the 8-bit world today. When GEOS appeared in the
Commodore marketplace, it gave the Commodore-64 a new lease on life...

ANALOG published, in Bits n' pieces, I think, a hardware modification to a Radio Shack 360 degree joystick so it could be used as a one-button mouse
for the 8bits. When I find it I'll post the issue date. I built it
and it cost me about $25--and that includes two (2) joysticks...

From: attcan!utgpu!watserv1!watdragon!lotus!rrwood@uunet.uu.net (Roy Wood)

Anyway, my question is whether anyone has seen the graphic user interface
for the 8-bits. I think that the product I'm thinking of is called "Diamond
Dos" or something.

There are actually two; Diamond and GOE, both of which are supposed to
be available as cartridges. I think GOE may have gone out of business,
however.
If anyone has seen this (or anything similar) in action,
what was your impression?

There's a demo version of GOE in the software archives. When I played
with it, I was pretty impressed. People who've used diamond say good
things about it, too.
I suspect it would be pretty bad, and the thought
of using a joystick in place of a mouse makes me cringe.

Use an ST mouse. Works great.

>I don't suppose it would be that hard, though you'd then have to write all your
>own software to take advantage of it. That might make a good project...hmm.
>Does anyone know where I can get a cheap mouse with basic technical specs?

I have done the following:

Connected the Trak-ball to the 8bit, and written a handler

Connected the Commodore mouse, and written a handler

Notes:

The Trak-ball (in native mode, not joystick-compatible mode) is
claimed by net-people to have the same characteristics as the ST
mouse. Clocks and directions come in over the four joy direction
pins. It was a matter of writing a small handler, which I put in
page 6 and installed with a timer interrupt, that looks for changes
and asynchronously changes xy coordinates in memory for whatever
application to read (Basic, etc).

I got sick of the trak-ball; only one button, too bulky, pressing the
button is too clumsy. I thought about mouses, and noticed that the
Commodore one has 2 buttons and is plug compatible.

The CBM has 2 modes - proportional and joystick. Prop mode has analog
outputs to the two paddle inputs, which don't work on the Atari; whenever
I read mine I get the value 3. So I use it in joy simulation mode,
after changing the handler to "integrate" the 4 joy direction lines.
(Note: games like millipede and missle command work real good with the
CBM mouse in joy mode, as well as some of the elementary drawing programs
like the one that came with the pen plotter.)

The two buttons are read 1) in prop mode, as trigger and one of the
directions and 2) in joy mode as trigger and one paddle input. 2 is
usable, although 1 would be better.

One other note: when I added VBI/DLI's to my application (drawing using
5-color character graphics) there was an interaction between the VBI
and the timer interrupt. I ended up changing the DLI to interrupt every
line, count lines, and call the mouse handler every like 8 lines; this
eliminated the need for the timeer interrupt.

I use player/missle graphics for the screen pointer. The top level
application calls a subr every time around the loop that updates the
pointer position. You don't miss mouse movements, but the pointer

can skip around the screen when the appl is busy. Works pretty good.

I have plans to make a graphic OS version of MYDOS. Wish me luck (in finding the time, that is.)
I have truly been having fun. -Stan

Thanks to everyone who has responded to my question about graphical operating systems.

So far, the consensus has been that the Diamond and GOE OS's are pretty good, and that they're even better with a real mouse. A couple of people have advised the use of an ST mouse - is it really as simple as just buying the mouse and plugging it in? Is the connector just the standard DB-9 (i.e. joystick) connector? That seems too simple.

And final question: I'd like to use a mouse for word-processing. Does anyone know if such a word processor is available? I'd also like an 80-column display, if I can find a word-pro that does both. I saw an advertisement in Analog that said "The Richmans" word processor supported 80 columns through software, and was mouse-ready. Has anyone used this? Does it take advantage of the 130XE's extra memory?

And while I have your attention, does the new AtariWriter need the XEP80 to generate the 80 column display?

Thanks in advance...

Roy Wood (rrwood@lotus.waterloo.edu)

2836. FIXXL

Another thing:

I have a 130XE and a bunch of old software that won't run on the 130XE. I've got a copy of the Translator, so I can run everything with only a minor amount of inconvenience.

My question: is there some utility I could get that I could prepend to these old programs such that the old 800 OS was loaded up before the program was run? I think that FIXXL was supposed to do something like this, but it doesn't work with the programs I'm using. Is it just me?

Just came from a users group meeting of PAC in Rantoul, Illinois.....
Has anyone else heard of "The Revolution" in which advertisers are trying to
stir up Atari enthusiasm? We received a letter from a company named
Artisan that was stamped with the message:

Join the
R E V O L U T I O N
Buy an Atari Computer

Or something like that. It sounds interesting and has nothing to do with
Atari Corporation. I believe the philosophy is: if Atari won't do it for
themselves, we might as well do it for them. Either that or a clever
advertising gimmick....

What are your thoughts?

There was something posted here maybe 4-6 months ago looking for support.
I took down the address, but ended up not writing them. (It was in like
NJ, wasn't it?)

BTW, I would like to do a software buy, sell, or trade. After buying
a box of someone's old collection of games, I ended up with a few
duplicates. They are:

Infocom STARCROSS: Still in the original packaging; the plastic flying
saucer. So far my favorite Infocom, except for maybe LGoP.

Infocom SUSPENDED: Likewise the original package, the one with the mask
of the sleeping face. (I haven't played my own copy of this to completion
yet!)

I would like to acquire Infocom STATIONFALL. If you would like to work
out a deal, just reply!

BTW, I've had a few requests for the mouse drivers I wrote. I will post
the listings asap, maybe tomorrow (I have to get the listings on a disk
and bring them to work.)

-Stan

2839. 130XE Memory tricks

Newsgroup: comp.sys.atari.8bit
Date: 1989-12-11 16:22:15 UTC
From: rrwood@lotus.waterloo.edu
Message-ID: <19168@watdragon.waterloo.edu>
Source record: 115243

I've been fiddling about with the bank selectable memory in my 130XE, and
I've been having a bit of a problem. It's easy enough to swap in and out
the bank at $4000-$7FFF, but I'm having trouble with the memory under the
ROMs. Bit zero of $D301 controls whether the upper 16k of the machine is
ROM or RAM, and I can turn it off and on without any problem. However,
I tried to do the following:

1) copy the ROMs down to lower memory.
2) swap out the ROMs for RAM.
3) copy the "ROMs" from low memory back to their original position,
and thus have the OS completely in RAM.

I took care to mask out all the interrupts I could think of (SEI, POKMSK at
$10 and it equivalent hardware register, plus the NMI hardware register).
Unfortunately, the machine still hangs. The screen goes futzy, as if the
character set has been redefined as garbage, and there's no response to
keystrokes. (Reset brings it back) By the apparent character set mixup,
it seems that the hardware is not addressing the RAM correctly, or something
like that.

Any ideas?

Also, what is the second-highest bit in $D301 for? I know the highest-bit
(bit 7) is for masking in/out the self-test ROM, but what is bit 6 for?
Does anyone have a copy of Mapping the Atari, so they could look this up?
(I have a downloaded file version of Mapping the Atari, but it's not very
complete.)

Thanks...

-Roy Wood (rrwood@lotus.waterloo.edu)

2840. Compuserve

2841. Mouse/Trakball Driver

Newsgroup: comp.sys.atari.8bit
Date: 1989-12-12 15:10:29 UTC
From: slackey@bbn.com
Message-ID: <49565@bbn.COM>
Source record: 115245

OK you hackers, here are a few of the routines I did for the various mouse trakball etc. fun stuff.

(1) Routine called in with the timer interrupt. This tracks the Commodore mouse, a joystick, and possibly the trakball in joystick mode, although I never tested the last case.

```
;
OLDVAL = $CB ;
HORIZ = $CD ;
VERT = $CE ;
JOYST = 54016
;
;
ORG $0600
;
; TIMER ROUTINE
;
TRAKVB:
TYA
PHA
LDA JOYST
TAY
AND #1
BNE X1
DEC VERT
X1: TYA
AND #2
BNE X2
INC VERT
X2: TYA
AND #4
BNE X3
DEC HORIZ
X3: TYA
AND #8
BNE X4
INC HORIZ
X4: PLA
TAY
PLA
RTI ;
END
```

This one just tests the various bits from the joystick inputs and incr/decr the vert/horiz position values. They go from 0 to 255 then wrap around; other versions I made allocated limit values in memory which would be tested before an inc/dec would be done.

(2) Routine for the trakball/ST mouse, on a timer interrupt. Actually, the routine is the same as a timer or VBI/DLI; it's just which vectors get set up that's different. Except for the VBI, of course, if you want to invoke the regular Atari VBI after the custom routine.

```
;
; Definitions
;
OLDVAL = $CB ;
HORIZ = $CD ;
VERT = $CE ;
JOYST = 54016
;
;
ORG $0600
;
; TIMER ROUTINE
;
TRAKVB:
TYA
PHA
LDA JOYST
TAY
EOR OLDVAL
AND #2
BEQ TSTVER
TYA
AND #1
BNE RIGHT
DEC HORIZ
CLC
BCC TSTVER
RIGHT: INC HORIZ

TSTVER: TYA
EOR OLDVAL
AND #8
BEQ EXIT3
TYA
AND #4
BEQ UP
INC VERT
CLC
BCC EXIT3
UP: DEC VERT
EXIT3: STY OLDVAL
EXIT2: PLA
```

```
TAY
PLA
RTI ;
END
```

The trakball has 4 outputs: bit1 is the horiz motion clock, with bit0 telling left vs right; bit3 is the vert clock, with bit2 up vs down.

The routine gets input and saves it in y. It exor's the oldvalue to see if there was a change in the clock, then rereads the newvalue to tell which direction.

(3) The BASIC program illustrates how you might load it.

```
10 OPEN #4,4,0,"D:FTRAK.OBJ"
20 GET #4,X:GET #4,X:GET #4,X
30 GET #4,X:GET #4,X:GET #4,Y
40 ADDR=256*6
50 FOR I=ADDR TO ADDR+X
60 GET #4,X
70 POKE I,X
80 NEXT I
110 CLOSE #4
```

It just gets the object (assemble the one you need for trakball vs mouse and stick it in FTRAK.OBJ). The routine eats the binary format header (you can check for validity if you're fussy) and saves the low byte of the length. It just sticks it in page6.

If you prefer, you could load it from DATA statements.

(4) This one is a simple demo/test program.

```
5 F=100:REM TIMER FREQ
115 POKE 528,0
120 POKE 529,6:REM TMRINT1 VECTOR
130 POKE 53761,0:REM VOLUME TO ZERO
140 POKE 53760,F:REM FREQ OF TMR1
150 POKE 53769,255:REM TURN ON TIMERS
160 POKE 16,193:REM SET TMINT1
201 INPUT G
204 TRAP 204
205 GRAPHICS G+16
206 COLOR 1
207 H=12*16+13
208 V=12*16+14
209 POKE H,20:POKE V,20
210 PLOT PEEK(H),PEEK(V)
215 DRAWTO PEEK(H),PEEK(V)
220 GOTO 215
```

Line 5 is to make experimenting with the timer interrupt freq. easy. (Lower values make the interrupt rate faster.)

Lines 115/120 set the timer interrupt vector to ^X600 .
130/140 set up the timer.
150 turns the timer interrupt on.
160 sets up the interrupt mask.

201 lets you select graphics mode. Reply 1 thru 8.
207/208 are just the addresses of the H and V coordinates.
209 initializes the coords.
215/220 are the drawing loop.

As you wiggle the trakball etc. you will leave a line behind. This was useful in setting the interrupt rate; too slow and you start aliasing, too fast and the Atari gets slow.

I have come a long way from these routines; I wrote them well over a year ago. They probably work. Write me if you have any problems.

Note: The interrupt routines don't handle the pointer on the screen, or test the triggers. My applications do that part themselves; I thought it was more appropriate that way, as that reduces overhead. You can't do "mouse-ahead" (as opposed to "type-ahead") like my Sun, but hey.

Have fun. -Stan

Hm, there was an article in ANALOG about 2/3 years ago that did this very
thing. I remember typing in the source code, and it worked. Are you sure
that you disabled NMI's by setting $D40E to zero? Also, as I seem to
recall (though I'm not sure), you may need to JMP to $E454 to continue
where you left off instead of just switching the O.S. back in.

>(I have a downloaded file version of Mapping the Atari, but it's not very

Wow! I can hardly find the book version, and have never heard of a file
version. Could you post/email?

2843. Need Help Porting Device Driver to SpartaDOS-X

Newsgroup: comp.sys.atari.8bit
Date: 1989-12-12 19:24:18 UTC
From: news@mfci.UUCP
Message-ID: <1159@m3.mfci.UUCP>
Source record: 115247

Does anyone know the rules for writing and installing device drivers under SpartaDOS-X? Could anyone point me to a reference that might explain the rules?

I have a very compact (fewer than 256 bytes) driver that replaces the P: HATABS entry with its own vector and translates XIOs to P: into the corresponding XIOs to one of the R: ports on the 850 interface. The driver also handles the problem of page breaks and single-sheet feeding.

I wrote this to interface a particular daisy-wheel printer (the Brother HR-15) that is equipped with a serial interface and has no end-of-page detection (unless one buys the cut-sheet feeder, which I didn't).

The driver works fine with AtariDOS and DOS-XL. Under these, I am able to print files from Riche's superb Textpro PD word processor. However, SpartaDOS-X's all-new I/O code renders my driver more than useless: it locks up my 130-XE altogether, regardless of where I load it. So I must leave my hard disk behind whenever I want to print a simple letter!

Sure enough, SpartaDOS-X's I/O database differs from AtariDOS's. But how?

Please reply:
wilson@multiflow.com or
wilson@mfi.uucp

If there is sufficient interest, I'll post a synopsis of replies.

Hurry, before I break down and buy an ST. :-)

Thanks,
Jeff

>like that.
>
>Any ideas?

Did you skip $D000-$D7FF when you copied ROM ($C000-$FFFF) to RAM? Did you
take care not to alter the other bits in $D301 (so as not to switch BASIC in
or out)? Did you make sure address 106 had the right value (this usually
has the value $C0 when no cartridge is plugged in, but if you
kick out the OS ROM, the OS might think that everything up to $FFFF is RAM and
thus PEEK(106) will be too high and it will set up screen memory at a very high
address, wiping out the OS).

>Also, what is the second-highest bit in $D301 for? I know the highest-bit
>(bit 7) is for masking in/out the self-test ROM, but what is bit 6 for?

It's marked 'reserved' but RAM upgrades use it for bank switching. Thus
you should leave that bit as is, because otherwise you may interfere with
ramdisk handlers and whatever other software uses it (like wordprocessors and
spreadsheets, for example).

2845. A.N.A.L.O.G. Magazine Subscriptions

Newsgroup: comp.sys.atari.8bit
Date: 1989-12-13 18:56:46 UTC
From: wrd@tekigm2.MEN.TEK.COM
Message-ID: <7559@tekigm2.MEN.TEK.COM>
Source record: 115249

Has anyone heard as to whether we will get a rebate on our unused A.N.A.L.O.G. subscriptions? Having just recently renewed it (and as a disk subscription no less) I would like either some money back or have my Antic subscription extended. While I have not heard anything definite, it would be good business for Antic to pickup subsribers, advertisers, contributors, etc., but whether they want to or can afford to is anyone's guess. Maybe a combination of all four magazines would leave us with one good 8/16 bit Atari specific magazine. Of course, I also renewed my subsription to Compute! just before it dropped all Atari 8 bit coverage. (My crystal ball has been quite cloudy lately.)

2846. Souping up the Atari cpu...

Newsgroup: comp.sys.atari.8bit
Date: 1989-12-14 02:38:40 UTC
From: Ordania-DM@cup.portal.com
Message-ID: <24993@cup.portal.com>
Source record: 115250

Ok, I know that millions of devoted atarians out there read USENET
religiously EVERY day just looking for some interesting articles. THIS
is one of them. :)

All you electronic BSers, PHD's (Piled Higher and Deeper :), etc...I
need your help. I want to speed up my Atari...doubling the speed would be
fine (3.59MHz) I just want to know how to do it.
Here is a description of the problem:
The atari 8 bit has 3 types of chips in it: 65xx, ram/rom, and
special purpose chips (antic, gtia, pokey). All the chips in the atari
can handle an increase in speed (the 6502 and 6520 can be replaced) EXCEPT
the special purpose chips. What I want to do is steal the a 3.59MHz clock
from the onboard xtal and direct it to everything except the special purpose
chips. The antic chip occasionally steals cycles from the cpu in order to
read directly from ram. Can this be done? If so, how?
[Redesigning the entire computer is not feasible, I just want to make the
upgrade on my own machine.]
If this is possible, could it be made switchable (to select 1.79/3.59)?

Thanks
Charles Hughes

First, thank you to all who responded to my last question about
terminal programs. Many were unusually helpful and I appreciated
the responses. And to continue, the obvious next question...

How can I hook up my Hayes 1200 baud modem to my Atari 800 ?
What is an 850 interface ? Do I need one ? Will Amodem work
with this configuration ? A local computer store tells me that
a $ 20 cable will work. Will it ?

There once was a day that I knew something about 8 bits.
Sort of.

Thanks in advance, again!

You might want to contact DataQue on this. I believe they have made some
attempts to up the clock on their Turbo-816 & had similar problems. As I recall
from my conversation with them, they has little success. When their new video
card come out there is a possibility that Antic et. al. could be disabled when
the new card is enabled. If you would like to contact DataQue, their BBS number
is 1-419-529-5197.

An 850 interface is a unit to let you use modems and serial printers with
the Atari 8 bit. NO YOU DONT NEED ONE to connect your hayes modem to an Atari
800. If the cable your local computer store is referring is rs232 on one one
and Atari SIO on the other end (if not this type of cable is available through
Sura Corp), thats all you need. That will make your modem
COMPLETELY compatibe with all the programs designed for the Atari SX-212 modem,
including Determ, SX-Express, etc. This is how I've been using my modem for a
few years, and it has always worked flawlessy. If you have any more questions
feel free to ask.

2853. fractals 4 real-time

Newsgroup: comp.sys.atari.8bit
Date: 1989-12-17 06:02:17 UTC
From: ssingh@watserv1.waterloo.edu
Message-ID: <412@watserv1.waterloo.edu>
Source record: 115157
Cross-posted to: rec.games.programmer,rec.games.video,comp.graphics,comp.sys.ibm.pc,comp.sys.amiga,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.cbm

The following is a transcript of a letter from Loren Carpenter dated April 18, 1989. It details the use of fractals for real-time graphics rendering. I thought it might prove interesting to those who are also working on their own implementations of these algorithms. I have Loren Carpenter's acknowledgement of this posting.

Relative to the fractal game algorithms...

Neither I nor anyone at Lucasfilm ever published anything, as far as I can remember. I did the one for Rescue and the folks at LFL adapted it for Eidolon and Koronis later. Ballblazer doesn't use any fractal code.

The algorithm is the simplest possible midpoint subdivision, subject to the constraint that the landscape be consistent from frame to frame. The random displacement is derived from 2 bits (sign & overflow) of the 8-bit sum of the tags on the ends of an edge.

```
if overflow then
displacement = 0 /* bisect the line */
else
if negative
displacement = -edge_length/4
else
displacement = edge_length/4
```

The landscape is a 16x16 mesh of edges, repeating forever over the plane.

There is a lot more detail, especially about perspective, but I'm not sure LFL wants me talking about it yet.

Loren Carpenter

Post Scriptum: For an in-depth treatment of fractals for graphics rendering, see Communications of the Association for Computing Machinery, Volume 25, Number 6, pages 371-84.

The "...constraint that the landscape be consistent from frame to frame..." may refer to the idea of pixel replication as seen in games like Afterburner and Outrun. Note that as an object gets larger, it also gets blockier. Fractal code can appear to create detail very efficiently, making the object appear more complex than is otherwise possible. This can also be seen in the player vehicles in Ballblazer.

Regarding perspective, two main techniques have been used in the past that I have noted. One is to use different shades of grey for mountains of

different distance, and gradually change colours as the player moves closer
or farther away. The other is most noticeable in Rescue on Fractalus,
where there is a mesh that converges in the distance on a vanishing point.

2856. Need Atari DOS with RS232 Console

Newsgroup: comp.sys.atari.8bit
Date: 1989-12-18 15:24:20 UTC
From: rvp@cbnewsh.ATT.COM
Message-ID: <6686@cbnewsh.ATT.COM>
Source record: 115160

Recently, I have been compiling code on my toshiba 1200 laptop
with a cross-assembler and uploading the binary files to my
Atari 800 using "BOBTERM" (It's great! - Shareware Check is in the
Mail!)

Now, I would like to progress to an ATARI DOS that accepts commands
and displays prompts over an rs232 interface (using either the
850, 2 joystick ports, or SI0; SIO would be preferable, cause I could
use this on my Atari 400, too).

Does anyone know of a DOS that does this?

Or, would it be a simple matter, for anyone who knows the guts of
any DOSes, to just somehow change a part of the DOS to use the R:
device in its I/O calls?
Mostly what I want from the DOS is to:
- accept atari load files from the rs232 interface and put them
directly in memory Could be xmodem, kermit, or just a raw, un-error-
correcting protocol, as transfers will go on a null modem cable.
(19,200 baud would be nice, too!)
- option to save the rs232 file in an Atari disk file is nice, but
not really necessary.
- ideally, I would want to burn this on a cartridge, so when I crash
the Atari in program development, I just hit reset for immediate
system recovery.
Thanks for your thoughts!
Rob Phillips

"Just a cable" will NOT do the job. If that cable is a Supra R-Verter,
you're in trouble. The R-Verter is a small plastic box, with one open
end having an SIO port, and the two cables sticking out the other end.

R-Verters don't work for $#!T. I've got one that I use for
null-modeming stuff from the 8-bit to the ST. As a regular modem
interface, it's lousy.

I recommend either the 850 interface, or if you want expandability, the
Black Box from CSS. The BB is a printer/modem/hard disk interface with
TONS of extra features. It sells for $199, but is really worth it.

I don't think there's an "easy" way of doing it, just a way of getting around a 40 column display. The only way I can suggest you to line up everything with an 80 column printer is to use underlines instead of spaces in the area you wanted to line up. Then, use print preview and make sure everything lines up right. Once everything's the way you like it, do a global search for underlines and replace them with spaces. Everything should be _printed_ all lined up right, but when you look at the file in AtariWriter, it'll look a little messy.

(At least this is how I always did it whenever I wanted things to line up with AtariWriter.)

(Didn't I hear of an 80 column AtariWriter that works with the XEP-80?)

ATW+ will support 80 cols!!!! You can specify up to 160 (I think). You will
get a 40 cols window that scrolls around on the n column page.

Hold the 'option' and press 'c', it will ask you how many columns you want.

This is a feature on ATW+ only, not the cart version of ATW.

=>
=>Does anyone know of a DOS that does this?
=>
I have used SpartaDOS 3.2d over an RS232 modem. A "PRINT R:" and "-R:"
takes K:/E: input and sends E: output from/to the R: device. You have to be
careful not to do anything funky, but it works otherwise. This trick doesn't
work with the 400 since you can't run 3.2d on it. It also won't work with the
SDX cartridge either unless you can get a COM: handler for it. If you can, you
should be able to do a "COMMAND <COM: >COM:" and get the same effect. There may
be COM: handlers on the ICD BBS, but I haven't checked lately.

=>Or, would it be a simple matter, for anyone who knows the guts of
=>any DOSes, to just somehow change a part of the DOS to use the R:
=>device in its I/O calls?
=>Mostly what I want from the DOS is to:
=> - accept atari load files from the rs232 interface and put them
=> directly in memory Could be xmodem, kermit, or just a raw, un-error-
=> correcting protocol, as transfers will go on a null modem cable.
=> (19,200 baud would be nice, too!)
=> - option to save the rs232 file in an Atari disk file is nice, but
=> not really necessary.
=> - ideally, I would want to burn this on a cartridge, so when I crash
=> the Atari in program development, I just hit reset for immediate
=> system recovery.

I haven't tried this, but you might be able to get the effect you want in
most DOSes simply by playing with the HATABS vectors. If you want a really
simplistic change you might just change the D: vector to point to the R:
driver's table. Alternatively, you could write a new device driver that takes
D: commands and processes them into cooked R: data, possibly adding an error
checking protocol. Why not just port NFS/SLIP to SpartaDOS & we can avoid the
whole problem? :-]

First of all, I hope I'm allowed to keep advertisments on UseNet...

I am pretty much out of the Atari 8-bit now, but have quite a bit of hardware and software that I would like to sell.

I have an 800XL, 850 Interface, 20MB Supra Hard Disk and tons of software and books. All components are in good working order and will be sold as a group or by the piece.

My phone number is 805-962-4022. My bulletin board number is 805-966-0041.

If it's at all possible, please reply to my home at the following address: patrick%wongo@anise.acc.com

> -Pete

I consulted the owner's manual (page 12) to find my that
Option C will change the number of columns displayed.

Of course if you change it to over 40, you won't be
able to see them all at once; but it should still
greatly simplify the problem.

Good luck,

Hi everyone;

I have decided to sell my Atari system. Included is:

48K Atari 800 with Omnimon
NEC 13" Color Monitor with sound.
Two 810 Disk Drives. One includes an Archiver Chip
Atari 1010 Program recorder.
Atari 850 Interface
DeRe Atari Programming Manual
Atari Hardware Reference Manual
Atari OS source Listing.
Assembler Editor Cartridge
Qix Game Cartridge
BASIC Language Cart.
Schematics.

Everything needed is included. Cables, power supplies, etc.

The asking price is $600.00
Everything works, this system is in mint condition.
If interested call me at (818)356-2974 during the day.

Apologies for wasting bandwidth, but I couldn't get our mailer to process your address. Also, this may be of interest to others...

Obviously you were able to log in as anonymous and request files, so I won't go into details about navigating through the directories. What you need to do to download binaries is:

1) at FTP> prompt, enter SET TYPE I
2) after confirming message (like TYPE SET TO I), use the GET command to request your file.

Note: if you issue a DIR command, type is reset to A (ASCII), and you will need to redo the SET TYPE I command.

One last item: when downloading from your local host (if I can use the expression) to your 8-bit, make sure both ends are set binary (at least if you're using Kermit). Hope this helps!

Max J.

2872. RE: RS232 DOS CONSOLE - LOOKING FOR DOS SOURCE

Newsgroup: comp.sys.atari.8bit
Date: 1989-12-20 23:41:32 UTC
From: rvp@cbnewsh.ATT.COM
Message-ID: <6802@cbnewsh.ATT.COM>
Source record: 115176

Thanks to those who contributed their thoughts to me on this!

I am encouraged to venture to modify some DOS source to conduct
console I/O over an RS232 interface.

For that, I need some DOS source (asm code) to modify. I saw
some DOS source in an ANALOG article a while back (I have the issue
at home), and rather than type it in, is this (or any other public
domain ATARI DOS asm source, for that matter) available for downloading
from any known bulletin board systems?
It could be for MAC/65 or any other 6502 assemblers
because I can employ "sed" or "awk" scripts to do the major
translations of these sources to my "PseudoSam" source format for my
PC-compatible.

I logged onto about half a dozen BBSes in New Jersey last night, and
all I could find were .COM files, which I would rather not
disassemble.

If anyone is interested, I would be glad to post my final code to
comp.sources.misc and announce that posting in this group.
Or, if anyone would like to work jointly, I'm game!

By the way, the discussion on the RS232-SIO cable connection in this
group is very interesting! If anyone would like to share knowledge on
this, this seems like the type of RS232 handler that makes the most
sense to me from an end-user cost standpoint, assuming other people
would be interested in using the Atari ROS (RS232 Operating System).

I suggest MYDOS; the source is in the public domain, and you can get it with a mini-assembler (which takes the same source as Atari's AMAC, except without macros).

I took copies when they were posted here several months ago. I could figure out how to repost them if you get desperate.

And now a MYDOS technical question: How is the mem.sav part of MYDOS loaded? Also, is it loaded at boot time, or when you enter "DOS" from BASIC?

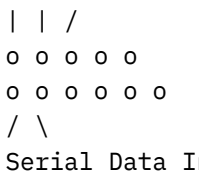
>------------------------------
If my memory serves me correctly, the SIO pins are



The serial data pins put out and receive TTL levels, i.e., zero to 5 volts.
RS-232 requires -5 to +5 volts and so there may be more than just a wire
connection required. I have used a Maxim MAX232 chip to convert from TTL to
RS-232. I don't recall which pins on the RS-232 connector are data in and data
out, but that info should be easy to get.

> I have been having a problem trying to get files from the terminator
[...]
1) at FTP> prompt, enter SET TYPE I

Careful. Not all the files on terminator are binary. Some are ascii,
in particular the ones Donald Simmons said he was trying to retrieve.

You should use Ascii mode for the files like .BAS and .TXT, binary mode
for .ARC. The readme file attempts to give some hints about what files
are what, and how to go about retreiving them.

Note: if you issue a DIR command, type is reset to A (ASCII),

... in some FTP user end implementations...
and you will need
to redo the SET TYPE I command.

... if you wanted binary.

The real caveat here is that you need to know whether you expect a text
or binary file, and make sure your FTP is set up accordingly.

One more question (awright, a few more :-)) and I'll let you
get back to serious computing.

How can I print a file in its entirety that my AtariWriter cart.
can't fit in its memory? Also, is there a pub. dom. word processor
better than AtariWriter? How can I get my greedy hands on it?

Thanks again!
Please reply by e-mail.

Steve

If pro is the opposite of con, what is the opposite of Congress?

Atariwriter has a 'merge file' command. I think it is ^V. At the end of the first module type ^V D:FILE oe something very close to that, I don't have the manuals here at work.

The best PD text editor that I know of is Textpro. The best editor is probably Paper Clip.

Hi
I recently acquired a supra hard disk interface (and hard disk) and I am
having trouble finding a cable for the printer port.
The specifics are:
36 pin male centronics connector (ribbon type)
40 pin card edge connector (ribbon type)
36 conductor ribbon cable (max 6 feet)
I'd be willing to build cable myself if I can find the parts, both Supra and
Radio Shack(where I live) where absolutely no help. if anyone can help please
reply to me either here or email

Thanks

From: sabba@cbnewsj.ATT.COM
Message-ID: <3181@cbnewsj.ATT.COM>
Source record: 115198

Hi Everyone:
Awhile back I complained about my computer switchbox & TV
not working together when I tried the switch on TV. The TV pictures
were awful and fuzzy.
Well, the solution is this. I bought an indoor antenna
amplifier at Radio Shack for $20 and hooked it up on the TV before
the switchbox. It works great! The TV pictures are clear. The
amplifier is just a little box and easy to hook up. I don't have
cable and just use the TV's little antenna.
Thanks to everyone, especially Stan, and hope this helps
everyone. I sent mail to everyone who wrote me. Hope it gets to
you.

Bye,
Diane

2895. Atari's Quarterly Results ($5.4 Million Lost) :)

Newsgroup: comp.sys.atari.8bit
Date: 1990-01-07 08:49:27 UTC
From: rohwerwd@csusac.csus.edu
Message-ID: <1990Jan7.084927.19588@csusac.csus.edu>
Source record: 115199
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

The following is from "The Business Journal", p. 28, for the Week
of January 8, 1990.

"Atari Corp. of Sunnyvale suffered a third-quarter
net loss of $5.4 million, or 9 cents per share, on net sales
of $81.44 million. During the third quarter of the year
before, the company earned $900,000, or 2 cents per share, on
on net sales of $98.8 million.

"For the nine-month period ended Sept 30, Atari had
a net loss of $1.78 million, or 3 cents per share, on net
sales of $252.96 million. It earned $12.14 million, or 21
cents per share, on net sales of $299.64 million during the
comparable period for the previous year."

Apparently, Atari is slowly fading into oblivion. :)

I don't read these newsgroups, so if you want to contact me, then
you will have to email messages to me.

>---- Angelo Trivelli at1r@andrew.cmu.edu

Oh, foo. I was hoping someone else would post this so I wouldn't have to drag out my docs, but I guess not. So, here it is, straight from the Atari Tech. Ref. Notes:

1 2 3 4 5
6 7 8 9 <-- the pins on the joystick _jack_ (not the plug)

1=(Joystick) Forward Input
2=(Joystick) Back Input
3=(Joystick) Left Input
4=(Joystick) Right Input
5=B Potentiometer Input
6=Trigger Input
7=+5 volts
8=Ground
9=A Potentiometer Input

(As I recall, the paddle buttons used some of the joystick inputs, but I don't recall which. You'll have to experiment.)

Message-ID: <1254@ariel.unm.edu>
Source record: 115203

A good friend of mine got her hands on a nice working Atari 1200XL for Christmas and now we're looking for game software. A few questions arise:

* What carts can it run? 400/800 stuff I know, but how about the XE software, that sort of thing?

* Do any national toy retailers (Kay-Bee, Lionel, Toys'R'Us) still carry 1200XL-compatible stuff in any quantity?

* Was the CBS game MOUNTAIN KING ever released for it, and if so, does anyone have a copy they'd be willing to let go of? :-)

Sorry to post this to the net, but when you see a solution to a problem you've had for years, you'll do almost anything for the answer (within limits).

OK. That should take care of the "why didn't you try all the possible backbones to mail your message" flames!

Diane,

I read with interest about the fix for the squirrly reception on the Atari 800. I tried to find the part at my local RS, but didn't come up with it. The best I found was an inline signal booster that required a power source and 2 cable ---> RCA converters. Is this what you are referring to? Do you have the catalog number for the part you bought?

Thanks!
Steve

Source record: 115055

1. Not all 400/800 software will run on it! I'm not sure, because I never owned one, but I think the 1200XL (minus function keys) is really just an 800XL or 130XE etc without the extra RAM to load in a new operating system: hence, you cannot use a translator. I hope this has been of help. If I'm wrong, I'd be interested to know. The upshot of this is is that you should be able to run ALL (I think--using the above knowledge) XE game carts, but only MOST 400/800 carts.

2. Mountain King was released for the Atari; I liked the game but don't have it anymore....

Hi there!

Some friends of mine are having some problems with their 1027 letter quality printer. They are using AtariWriter on a 65XE (I think it's AtariWriter-- it's been years since I've worked on my 800 system!). The problem is that when they try to print out a document, the printer starts to print, but then with now warning, it starts to print garbage and skip spaces and such. I'm 150 miles away from where they are so I only know what is wrong from what they say over the phone. Any suggestions for a fix, or does it sound like the printer is dying for good? I have suggested cleaning the printer up and checking the cables, but after they swapped in some good cables the problem was still there. Any help would be greatly appreciated!!!

Mine did the same thing, a good cleaning job fixed it right up. You have
to clean the rails for both the print head and the strike plate since they
both slide back and forth. Use a silicone type lubricant to re-oil the
rails. Regular machine oil tends to collect dust too quick. I used a
lint free swab (no Q-tips, the cotton fibers get stuck on the rails) and
cleaned the rails with WD-40 first (since the old oil was gummed-up) then
I cleaned off the WD-40 with Isopropal Alcohol. After they dried I put
on the silicon lubricant stuff. Works great now, if only it was faster!

> printer is dying for good? I have suggested cleaning the printer up and

Doing the cleaning mentioned above should fix it right up, don't toss it.
Hope it helps out...

Actually, the 1200XL has a different OS than the 400/800, XEs, and 600/800XL.
So it has trouble with some 400/800 AND some XL/XE software, since it's a breed
all of its own. It does have a full 64K, and will run a translator. In fact,
a translator should almost be standard equipment. :-) Good Luck!

---

2 Questions....

1) Just got the "most recent" XEGS cart release...Airball. I like
it! But it is hard...has anybody won? Where do you get a lamp/
flashlight? Seems too difficult and the instructions are fuzzy.
Any help/hints will be greatly appreciated!

2) Is this the end of the XEGS carts? Atari announced several
carts last summer...Xenophobe, Midi Maze, Mean 18, Ninja Golf,
Commando, etc....but I've seen none materialize, and I've heard
no more announcements for Atari. Yeah, the 8-bit market is just
about dead, and how long can you expect new products, but since
Midi Maze, Commando and Xenophobe were shown last summer, I expected
Atari to at least release these games. What gives Atari?!?!?!?!?

-Ray

PS - any word from legendary shareware programmer Bob Puff?
Anything new on the horizon???????????

Does ICD still make this beast? I've been tempted to put an 8-bit system together for the hell of it. Also, will the SCSI ports on it play nice with Seagate ST1xxN drives, particularly the ST157N? Also, what's the scoop with using a T-816 in a 130XE along side an MIO Board with SpartaDOS X?

2916. Highly Technical Hardware Question

Newsgroup: comp.sys.atari.8bit
Date: 1990-01-15 17:08:15 UTC
From: gdtltr@maplenut.it.udel.edu
Message-ID: <8254@nigel.udel.EDU>
Source record: 115070

I am having some problems with my 130XE after doing some hardware hacking on it. I damaged a line or two removing a broken socket but managed to trace them and rewire them. Now I am having a problem with my disk drive. It appears that the data coming from the drive is getting scrambled. Disk directories list some entries properly, but others have messed up characters. I think some of them have bit 2 (the "fours" bit) stuck low. I don't have the schematics of the 130XE, so I can't even tell which chip has the problem. Data read from files was ok to start with, but now seems pretty munged. Fortunately, the problem does not seem to bother the ECI (parallel port), so my MIO still works. Any tips on what to look for would be appreciated. In case it might help, the hardware mod I did was the installation of the Turbo-816 and Turbo-OS, which seem to be working perfectly.

=>
Well, I guess I'm the guy to ask. I got all this stuff. As far as I know,
ICD still makes the things. Good luck getting them from a third party vendor.
Better off just getting one from ICD. Last I heard, ICD still suggested that
you avoid imbedded SCSI drives, like the Seagate N-series. I think it will
work, but you have to break a pin on the SCSI cable. You might take a look at
the Black Box if you aren't set on a nice big external RAMdisk; it is supposed
to handle the N-drives ok.
After several months, I now have my T-816 chatting properly with my MIO. On
the 130XE you have to add a couple wires & a 74LS04 chip (piggybacked on the
74LS08) for them to get along. Without this fix, my T-816 tended to trash data
routed through the MIO (RAMdisk, Modem, Printer, etc.). It isn't a very tough
fix, but you have to get the chip & do some semi-tricky solder work. I'm not a
big solder-jockey, but I managed it pretty well. The SDX works fine with both.

Rich Martin,
You asked if any one has a copy of the translator disk. I do and I should be able to copy and upload it to my account. The only thing is that you will need the program DISKCOMM to decode the crunched file. I can also send that if you n eed it. I'll try to upload as soon as I get a chance.

Also, since I'm new to this list, could someone tell me how to get back issues of digests from here. And could some one also please let me know if I sent thi s correctly. Thank you.

Well, this query sure has produced a lot of differing speculation.

As far as I know, the 1200XL OS is very similar to the one in the 800XL, which is in turn indistinguishable (from the program) from a 65XE.

So, I would like to know: Does anybody know FOR SURE of cartridges which work on an 800XL / 65XE but do not work on a 1200XL?

Just curious,

Hans

1. Not all 400/800 software will run on it! I'm not sure, because I never owned one, but I think the 1200XL (minus function keys) is really just an 800XL or 130XE etc without the extra RAM to load in a new operating system: hence, you cannot use a translator. I hope this has been of help. If I'm wrong, I'd be interested to know. The upshot of this is is that you should be able to run ALL (I think--using the above knowledge) XE game carts, but only MOST 400/800 carts.

I believe the above statement to be incorrect. I used to be an Atari enthusiast, and my father still owns several of the 8-bit models. If I remember correctly, the 1200XL was originally planned as a replacement for the 800, with new ROMS. Unfortunately not all software was compatable with the new OS and the product did VERY poorly. To correct this problem, Atari came out with a translater disk which makes the 1200 act like an 800. I am not sure which software works and which doesn't, but it would definately be worthwhile to get the translator -- I suggest calling Atari, as it used to be free. As for the newer models, they replaced the 1200; this time Atari made sure they were compatible with the original.

Having owned (and still own) a 1200XL (modified to 256k), a stock 1200XL, an 800XL (modified to 256k) and a 130XE, I have not found any difference in what the four will run. The only differences between the 1200XL and the other XLs are: the 1200XL requires a BASIC cart (BASIC not build in) and it does have the "function keys" and corresponding LED's. The OS seems to be the XL OS. It is not the same as the 400/800 OS and requires the translator disk for any program that the other XL would require it for. Interestingly, though, when you modify the 1200XL to 256k with the Newell board, the LED's show memory bank useage and not what they were originally intended for. I would describe exactly what they do, but I am at work and it is at home and my memory is not too good. However, I have not used too many carts in it, other than Atariwriter and the two types of BASIC carts. I mainly use programs on disk (using a 1050 DD). The disk programs have always worked, including all sorts of different games. A few required the translater, but they also required it on the 800XL or 130XE.

Has anyone actually found something that will not run on a 1200XL but will run on any other XL or XE?

In ANALOG a few years back, there was one program that did something to the keyboard (I think it made the key repeat rate faster) and I believe that the article mentioned that it worked on the XL's except for the 1200XL. It was a long time ago, so I can't be sure. But if this is the case, it would seem that some timing vectors or such may be marginally altered in the 1200XL. In any event, I seem to remember that the difference, if any, was not great.

The Koala pad uses the pot inputs on the joystick connector. The pad position is converted to a pulse width modulated signal which is applied to the pot inputs.

The pad buttons are read like normal joystick switches.

More than likely, this is because the program you mentioned jumped
into the OS ROM at an undocumented location, or used an otherwise
unsupported feature of the OS ROM.

Atari provided a vector table for entry providing documented entry
points into all of the documented OS routines. The reason for the
vector table was to allow updates to the OS to not break software.
Unfortunately, in the 8-bit environment, more often than not
programmers threw such guidelines to the wind. After all, they were
writing to the hardware registers to get graphics to happen on the
screen; why not treat the OS ROM the same way?

Software that runs under one version of the OS and not the other is
broken, plain and simple. That doesn't alter the fact that such
software exists -- which is why the XL's have the Translator disk
available.

"What else is the Koala Pad good for?" Well, I use mine with MicroIllustrator (I bought it used, privately, and it came with MicroIll.) The Koala Pad also works with MicroPainter, I believe, and with Fun With Art and probably Atari Artist (I think that last one came with the Atari Touch Tablet, which is what I was trying to buy [new] but was no longer being manufactured - darn magazine advertising scheduling!). There are also some PD/etc. programs out there that use it, e.g. Trails in ACTION! (ANALOG mag. - R.I.P.), something called Pixel Artist Deluxe (which our club's copy of, won't save to disk unless it was just a glitch in my friend's PD disk - but it acts like a bug in my humble eyes), and even Diamond GOS (but a mouse/trakball is best for that).

I still have my 1200XL (althogh it's collecting serious dust in my parents house) and I seem to remember running everything my friends 800 (old) would run, as well as the 64K games (The Eidilon from Epyx/Lucasfilms). The translator disk worked as well. In fact, I used to store several games that needed translation on one disk, and boot using some strange combinations of translators and menu makers! The only thing I can remember not running off hand are some games with cartriges that were too big for the 1200XL's tight port...

>
>-Stan

I think that the 3rd dragon has to be killed with all blue fireballs (type '3' on the keyboard). I don't remember the rest. If you want to cheat (as I did), go in with a disk editor, and take a look at the directory sectors. You will notice that there _is_ a directory of files in there, after a bogus 'copyright, etc...' directory. There is one directory entry that causes the directory list to stop, so remove it with the disk editor, then you can access the files with DOS. There's files, "LEVEL1.MAP," "LEVEL2.MAP," etc. First, you want to delete LEVEL1.MAP-LEVEL6.MAP. Then, do a copy of LEVEL7.MAP to LEVEL1.MAP, then LEVEL7.MAP to LEVEL2.MAP, etc. What you are doing is making it so that when the program accesses the drive, looking for _files_, it will find LEVEL1.MAP and load it, but it is actually LEVEL7.MAP, so you will start out on the 7th level, fighting that ugly 7-headed dragon. The ending is a bit disappointing, but at least this way you can see it without having to spend 3 hours getting there.

DISCLAIMER: THIS IS A POTENTIALLY HAZARDOUS PROCEDURE TO YOUR DISK. Do it at your OWN RISK; you may hopelessly scramble your disk if you don't know what you're doing. I strongly suggest doing it on a backup. Even if this doesn't work, you can still mess around with the neat .CEL files on there, and totally screw the graphics up for fun.

I cannot recall the 1200XL ever having problems with Atari-made cartridges.
I seem to recall a few third party carts that had problems with the new OS.
(This was about 7 years ago, so pardon my rusty memory. :-) Some 3rd party
carts had trouble physically fitting in the 1200XL's cartridge slot, which
is recessed in the left side of the case. XL/XE carts should suffer neither
problem on the 1200XL. (Boy, it's kinda neat to reminisce about the good 'ole
days. Makes me wish I had room for my trusty 800 at school. Ah, well.)

> Hhat else is the koala pad good for?

The Koala Pad can be read through the use of the PADDLE(x) and PADDLE(y)
functions of BASIC, where x=0 y=1 if in port 1, or x=2 y=3 if in port 2.
(Or even x=4 y=5 or x=6 y=7 for all us old-time four-porters. :-)
The PADDLE functions will return values from 0-255, depending on where
the pad is touched. The upper left corner is (0,0). (The values returned
are actually in the range of about 14-218; your milage may vary.)
If the pad is touched in more than one place, the approximate midpoint will
be returned. Use PTRIG(x) to read the left button, and PTRIG(y) the right.
PTRIG returns 0 if the button is pressed, 1 if not. (I think. Man, it's
been a long time... If not, it's the other way 'round.)
A (very, very) simple drawing program would look like this:

```
10 GRAPHICS 24:SETCOLOR 2,0,0
20 COLOR PTRIG(0):PLOT PADDLE(0),PADDLE(1):GOTO 20
```

I thought that RAMbrandt was supposed to work with Koala, Atari Touch-Tablet,
and joysticks. (I don't own it, and it's been a long time since I saw an ad.)
Incidently, the Atari Touch-Tablet works in an almost identical manner,
except the y values are inverted ((0,0) is in the lower-right corner).
Hope that helps. Good luck!

2937. Re: Games For The 1200XL

Newsgroup: comp.sys.atari.8bit
Date: 1990-01-20 20:31:54 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <26152@cup.portal.com>
Source record: 115090

In a recent article, Lazlo (lazlo@ariel.unm.edu) writes,

> A good friend of mine got her hands on a nice working Atari 1200XL...

> [more... deleted... CFC]
>
> * Was the CBS game MOUNTAIN KING ever released for it, and
> if so, does anyone have a copy they'd be willing to
> to let go of? :-)

Well, I have a copy of the game, but I still play it MYSELF (never knew anyo
else who'd even HEARD of it before!).

This raises in my mind a question I've had before: if a company no longer pro-
duces a particular "copyable" type of product, does this change the legality
of MAKING copies? I.e. , I assume CBS is no longer making or marketing
MOUNTAIN KING for the Atari 8-bit computer; therefore they are making no
profits from it; therefore if I make a copy of MY copy for Lazlo, is it still
illegal, and if so, WHY? The usual argument one hears against copying soft-
ware is that it amounts to "taking bread out of the mouths of programmers'
bbabies," but in this case it is NOT so doing (they aren't making anything
from the product anymore, even if I DON'T copy it), so oughtn't it become okay
to make a copy? Particularly if this is the ONLY source of the game anymore?

I'd be interested in hearing from someone who knows the truth of this par-
ticular situation; perhaps it's time for a new clause to evolve in
copyright law!

If memory serves, a copyright lasts for some ungodly length of time,
like 50 years. Ergo, it is not LEGAL to make a copy for Lazlo.
However, the more important question is: is it MORALLY wrong to do so?
Personally, I can't see CBS complaining. They haven't sold the game in
ages, they don't make money off of it anymore, and they don't even have
an electronics division anymore.

I'm not saying that you should go ahead and do it. If the game was
still in production, I'd be strictly against copying it. However, this
is not the case.

Yet another post about this infamous computer. I had one until about 3 years ago(when I switched to the 64. I now have an Amiga. No flame about this folks!). All of the programs worked, either by themselves(XL compatible) or with a translator disk. I had pretty many carts back then and had no trouble plugging anything in that didn't work. The only problem that I have encountered was a physical one where it didn't fit in the slot.(Airplane simulator from EMI software or something) All of the XL/XE stuff should work. The only reason Atari dumped this piece of the work horse was because they wanted to put BASIC in ROM and they tried to make an expansion port in the back.(I think they wanted to design it similar to the 64 seeing their success) As far as I know, very few, if any, hardware came out that used this port. And also about that program published in Antic(or something), I believe that it was supposed to let you control some of the neat things that are already programmed and available on the 1200XL via some function keys(in addition to the Start, Option, Help, etc.). For example, pressing some keys in combination of the keys gave you some of the extra cursor controls that were not available on the later models because they lacked these funtion keys. I had the game Mountain King. It worked very well with my 1200xl. Anyway, evrything that is out for the XL/XE should work for you. I've had the 1200XL for about 5 years until I got rid of it and never had any software compatibility problems. Also, the thingy about the serial port is true. The original 1200XL designers didn't want hardware using the computer power so they put in a resistor.(however, you could jump this if you want things like XM301 to work:XM301 uses the computer power.) I hope this helps... a little.

To all who need the Translator Disk. I have just finished uploading
it to my CMS account. You will need copies of the program DISKCOMM
, an UNARCer, and an UUDecoder to un-crunch the TRANSLATOR file
you need the UUDecoder to decode the DISKCOMM and TRANSLATOR files
then you have to UNARC the DISKCOMM file, then using the DISKCOMM
program to un-crunch the TRANSLATOR file. I have copies of all
the programs required, if in need of one or more of the files just
send me e-mail requesting the types of files needed.
The uploaded version of the translator program has not been
tested since I uploaded it. It should work, if not, let me know
and I'll see if I can get a working copy uploaded.

Darlin'... sorry ta dissapoint ya, but the 400 system with recorder and cartridges you described is worth closer to $50 than $150. I know it's a shock, but sometimes life's a b*tch. Don't feel bad, I bought my first Atari in 1981... paid $400 for the computer, $300 for a 48K upgrade, $150 for a real keyboard, and $550 for an 810 disk drive. For that much these days I could have a decent AT clone... not ta mention the time value of money over the 8 years. Nonetheless... Ataris will never die in me heart.

Jack Pettrey

2954. Atari SX212 Modem FOR-SALE

I have a used (in LIKE NEW) condition Atari SX212 Modem forsale: @ $75.00

This includes: The modem, ALL original DOCS/box etc.
An SIO cable for YOU 8-bit owners+Kermit with the SX header
to let you use the modem directly with your 800/800XL,etc.
(which is how *I* used the modem, until selling my Atari, to
upgrade to my Amiga 1000.)

I am selling the modem, because I BOUGHT another 1200 baud modem, this one
worked flawlessly up until *I* bought my other one. The price is FIRM, but
I might dicker some... write me and lets see what we can do...

p.s. The disk with Kermit on it is SS/SD, and is *2* sided (ie. I notched
both sides..) and has ALL versions of Kermit on it, plus the doc file
for kermit.

p.p.s Hi Xet! I gotta write you soon!!!! Drop me a line sometime...

I recently downloaded such software from compuserve. It does not handle all control character situations(i.e. graphics) but does display in 80 columns without any special hardware. Depending on the quality of your monitor, the character set is variously readible. I'm just using an old TV, in black and white so it works fairly well. I good monitor would probably be clearer. The file name downloaded was vt10sq.arc, I think.

I have a copy of a VT100 emulator from Antic which sort- of works. Though it sometimes screws up when I'm doing vi. Like it sometimes gets locked up when I try to ESC. Anyone else have this happen. I have a Atari 800 and 850 interface and Hayes 1200 smartmodem.

I used to have a friend that had a program to do what you want, althoygh I think it only did 40 columns with scrolling (or flipping) it worked with and xm301 modem, and as I don't have an 8-bit anymore, I don't know how compatible the sx212 is to the xm301 (if at all). I can try to find out more if you want to e-mail me, or respond here. I don't remember whether it is pd, (or even if he still has it), but if you think it might work, I can check into it...

If it looks like I said it, I probably did...

2959. TIFF file reader

Newsgroup: comp.sys.atari.8bit
Date: 1990-01-26 23:24:51 UTC
From: potter@speedway15.DAB.GE.COM
Message-ID: <3288@ge-dab.GE.COM>
Source record: 115113

On the request of another user (Ray Wilmott) I created a program to read and display TIFF format picture files. TIFF is used in MacIntoshes and IBMs to interchange mostly halftone images. My program interprets these and scales them to the Atari screen in either graphics 9 or 15 (7.5). It works much like my APACVIEW and ILBMREAD.

The question is: is anyone out there interested in using this program? Does anyone have a reliable source of TIFF images? Can anyone point me to a BBS or pay service that does? It may be a little difficult uploading the program to the net as my Atari is not connected.

Thanks,
Jeff P.

Yes, there is a VT100 emulator out there (somewhere) and it is pretty good.
You can try the atari archives, I think there is a version in there.

[The previous posts discussed vt100 emulators for the 8-bit]

An all-around good terminal program is KERMIT65.ARC, which I think is available on terminator. It does Kermit, as well as 80-column vt100. Actually, I can't comment on how reliable it is, since I don't use my 8-bit much anymore. I did use it to transfer files to and from my ST at 9600 bps, and it had no problems.

2962. Lots of information on the Atari Lynx

Newsgroup: comp.sys.atari.8bit
Date: 1990-01-28 06:45:53 UTC
From: jbm@uncle.UUCP
Message-ID: <671@uncle.UUCP>
Source record: 115116
Cross-posted to: rec.games.video,comp.sys.atari.8bit

Facts about the Atari Lynx

b=bits, B=bytes (god this is going to go on forever)

Processor: 65C02 at 4MHz
RAM: 64KB
16 bit multiply and divide unit, accessed as memory mapped I/O
Display: 160 x 102, 8K RAM, active matrix, made by Citizen
Graphics: 16 colors from a pallette of 4096, one pallette change per scan line
Sprites: Hardware sprites, scale, flip, collision, etc.
Audio: 4 channels, 8 bit D/A per channel
Comlynx speed: 625Kb, no physical device limit, access by asm macros
Cartridges range from 1Mb to 16Mb
All info on the cartridges is flashed out in 4K chunks and unpacked on the fly
There is no built-in ROM
Standard language: 6502 macro assembler
Two different kinds of developement systems, both use Amiga parallel port:
Howard/Howdy: ICE, logic state
Pinky/Mandy: Romulator
All development hardware currently being hand build and tested.
All development software is currently Amiga dependant.
Sprite construction tools available
Graphic and sound formats are IFF

Peripherals: lots talked about, none officially in production
Games coming: Gauntlet, Rampage, Chips Challenge, Psynophobe, Ninja Geidan
Atari will offer cartidge production services for outside companies. Rough cost on 1Mb cartridges with a sticker on them is $10 each in 5000 minimum quantity.

To get on the small-fry game developers' waiting list, Fax a description of you company, capabilities, experience and what games you want to port/create to (708) 629-6699, Attn: Craig Erickson. He's a busy man, so just let him know you're out here for now.

It is very easy to believe that Atari is ready and willing to cooperate with outside developers. Since Atari has lawsuits pending against Nintendo, it would be a very hypocritical of Atari to attempt some of the things ^ does.

The information above was obtained in a phone conversation with Craig. I do not, nor ever have worked for Atari. If I were in Atari's shoes I would be getting detailed hardware specs widely distributed to anyone who wants them. I think there are a great many wonderful games out there lurking in the minds of video game junkies and programmers. In some ways I can understand Atari overpricing development systems to keep non-serious individuals from tieing

up the resources of their internal departments. I think a copy of the specs and a discount coupon should be mailed directly to each and every Amiga owner. There are hundreds of Amiga programmers that would kill to hack on the latest and greatest incarnation of the Amiga graphics hardware. There are also a tremdous number of Aplle][programmers out there, who have for years though, "can you imagine the stuff we could write with a faster processor and graphics hardware?" I think the infusion of new thought on this new product would far outweigh the extra effort it would take on Atari's part to contact those people. They could even sell the effort off to a marketing or magazine company.

My kids are 3 and 5, and all I used to hear was Nintendo. After a couple of hours with the silly cartridge that came with it, all I hear now is "Dad can I play with that new video game?".

Things do change.

John

There is one other program that I
have heard of that claims to be a VT100 emulator for the 8-bits. It is
called Omnicom and is available from someone in Dallas for a small price of
$10.

Or for free, in the terminator archives.

Kermit65 (unsure of which version) is available from a BBS in Columbia
MO (no cost).

Or in the terminator archives.

I've seen a bunch of questions on this list lately about PD program availability; I guess that means it's time to repost the description of the archives.

There's an archive of Public Domain and Shareware programs for Atari computers on host TERMINATOR.CC.UMICH.EDU, which includes a section devoted to the venerable 8-bitters. The archive is accessable via anonymous FTP, to anyone connected to the Internet.

To retrieve files from the archive, use the FTP program on your system to connect to terminator, and login as "anonymous". Set your default directory to "/atari/8bit/". If you then get a directory listing, you'll see a bunch of files, including instructions on how to get started, and an index of what files are there.

If you have something that you'd like to contribute to the archives, mail it to me, and I'll install it.

Questions to me. Enjoy!

2969. VT100 (Kermit)

Source record: 115125

To those of you who need a VT100 emulator or Kermit, I have a new version of Kermit65 that does VT100, VT52 and Glass tty emulations, in 80 column graphics, 40 panable and plain 40. You can set parity to even, odd, none, mark. variable baud and file transfers etc. Its basically the same as the Kermit65 that is at the FTP site 35.1.33.8 with a few modifications, MPP (modem) support, which is a direct connect modem that was made by the company now known as Supra. You need DOS XL to run this version. I have been beta testing this version of Kermit65 for Jean Goulet. So far I have had no problem using this program, except if you are using an XL/XE you need the translator disk. At this time however I am not allowed to distribute this version of Kermit, but I will ask Jean if it is ok to send out copies.

That is VT10SQ, Kemrit65 workes 10 times better. I have both and found
that vt10sq was terrible when it came to screen editing, however Kermit65
worked flawlessy, between the two I prefer Kermit65 much better

>I already mailed this request in holland but I did get no response...

I used to work with a fellow who did some amazing things on an 800, and he
was quite happy with the ACTION language cartridge. This fellow was a C
programmer by trade, and knew how to use LEX & YACC to build new languages,
so I take it as a credible endorsement from someone who knew what to do.
Using ACTION, he ported Dr. William Gale's META4 compiler writing toolset,
which was written up in Dr. Dobbs' Journal years ago (also see PIDGIN, ibid).

You might check among the Atari ranks to see if ACTION is still around.
I hope this helps. I don't follow the Atari or 8bit stuff these days,
but I still keep my old faithful Ohio Scientific 6502 based disk system.

Best Regards!

2974. Kermit65 (vt100)

>Facts about the Atari Lynx
>
>Processor: 65C02 at 4MHz

This is a peak figure. When the CPU crosses 16-byte page
boundaries, the cycle is 3.2 MHz (can't stay in page mode forever). BTW,
the '02 used doesn't have the "Rockwell instructions."

>16 bit multiply and divide unit, accessed as memory mapped I/O

More correctly: 16x16=32 signed and unsigned, 32/16=32 unsigned,
and the remainder is broken. Multiply happens in 15 cycles, divide in 50.

>Display: 160 x 102, 8K RAM, active matrix, made by Citizen
^^^^^^^
Not according to the rumor I've heard. Atari Japan thought they
knew better, and used a different source. As a result, the screen is less
bright than it could have been.

>Graphics: 16 colors from a pallette of 4096, one pallette change per scan line

Actually, you can change colors anywhere you damn well please.

>Sprites: Hardware sprites, scale, flip, collision, etc.

You forgot shear, and realtime picture decompression.

>Comlynx speed: 625Kb, no physical device limit, access by asm macros

Typo; it's 62.5K baud.

>Cartridges range from 1Mb to 16Mb

Unless they did something immensely clever, maximum cartridge size
is two megabytes. Oh, you're talking *bits*. Why can't people use the same
terms?

>There is no built-in ROM

Wrong. There's a boot-up ROM which performs system initialization,
RAM tests, and the RSA decryption on the cards.

>To get on the small-fry game developers' waiting list, Fax a description of

Epyx is supposed to be the official coordinator for Lynx software
development, so you may wish to contact them first.

>In some ways I can understand Atari
>overpricing development systems to keep non-serious individuals from tieing
>up the resources of their internal departments.

The reason the system costs $5000 is because it costs $5000.
They're not making any money off the Howard boards or the software. When
you factor in the phone support, they're just barely breaking even.

>I think a copy of the specs
>and a discount coupon should be mailed directly to each and every Amiga
>owner.

Tee hee. Nice idea, but it'll never happen. One of Atari's first
questions to Epyx was, "Can we port the development system to the ST?"

From: weaver@tut.cis.ohio-state.edu
Message-ID: <76463@tut.cis.ohio-state.edu>
Source record: 115133

As far as I know, almost all carts for the XE/XL systems should work
on the 1200XL. Some of the new Atari cartridges released for the "XE
Game System" (really 65XE) will not work on the original 400/800
due to the fact that some of these new carts are 64K carts, and use
memory handling only found in the XL/XE operating system.

You will, however, have problems using any device on the serial bus that
requires power from the serial bus (XM301 modem, ICD P:R: connection) since
Atari clipped the power connection to the serial port in the 1200XL (don't
ask me why!) This can be fixed by a jumper mentioned in this group
a number of times before.

andy...

Re: Vt-100 emulators. I've used the original OmniCom, which requires the OMNVIEW 80-column chip, for several years with excellent results. The standalone version should be identical apart from having some additional code to load (since the 80-col E: device is in RAM rather than ROM). If it's still available for $10 that would be a reasonable choice, as would John Dunning's freeware Kermit65. OmniCom supports both xmodem and kermit and also has ascii capture and a very handy "print screen" function which is great for capturing short e-mail messages, names and addresses, etc., to paper without hassle. Kermit65 was sort of unfinished when I last saw it, but if John Dunning has put the finishing touches on it by now, it should be a very satisfactory program too if you just want the kermit protocol. -John Sangster

Way back eight years ago, I bought my first computer, an Atari 800XL, when
it just came off the market. Remember the Alan Alda commercials? Well,
That was the time. Any way, with a 1050 disk drive, the setup cost over
$1000 dollars. Forget about such add-ons like my Indus drive! Three years ago
I switched a accidentally broken 800XL with a 130XE for $100. Now I don't
know if I can get even that for my setup, which now includes a moniter, a
Okimate color printer, and a huge software library. Why should I sell it?
Nintendo is boring in comparison, and up to last year I did all my major
papers on it. Yeah, now I have a Mac. It's tough having a orphan computer,
caused by the bumblings of Warner and Tramiel. Oh, well. It'll always be
a fixture back home.
I just wanted to ramble about the good 'ol days

The poster of the article-to-which-this-is-a-followup asked if ACTION! is still around.

The answer is: You bet it is! I have had ACTION! for oh, around 5 years now, and although I don't have a LOT of time to program with it, I have a goodly amount of C programming experience ('been a UNIX/C guy since '79/'80, depending on whether you count school) and: I THINK that ACTION! is the BEST 8-bit language you can get! It may not be "portable" to other 8-bit machines, but if one is a REAL DIEHARD Atari (8-bit) user, who cares if it will run on them other pieces of garbage? :-) Aside from BASIC and assembler (machine lang.), more programs are written in ACTION! than other languages - and ACTION! is structured somewhat like PASCAL (with IF...FI, DO...OD borrowed from ALGOL, if I recall correctly what little ALGOL I ever knew), but not as strictly typed (typing is more akin to C, actually types CHAR and BYTE are interchange-able, for example...), yet not as cryptic as C (i.e. the language doesn't have so many ways to write one statement, most of them unreadable :-).

Get your hands on an ICD catalog for their price (maybe $79.95, I have it at home) and check with your dealer - you can usu. get ICD carts. for much less from a dealer. (I got SDX for $60, lists in ICD for $79.95, or at least it did, MEMORY FAULT***** :-)

Have fun!

Hello all,

I have an atari 800xl and I also have cable. I seem to have a problem though when I hook the cable line to the switch box for the 800xl. I get static when I use the computer and static when I watch cable. Is there something I can do about this? BTW the Tele is one that automatically tunes in the signal. I am under the impression that it is getting a real low signal from the other source on the switch box and trying to tune that in. Is there any way to fix this? Has anyone else had a similiar problem??

John.

2984. MYDOS and the XEP80

Newsgroup: comp.sys.atari.8bit
Date: 1990-02-02 18:49:26 UTC
From: slackey@bbn.com
Message-ID: <51672@bbn.COM>
Source record: 115140

First of all, I missed articles 3569-3596 due to my server being offline for several days. and would be EXTREMELY grateful is someone would send them to me.

Second - A few months ago I discovered that there was a compatibility problem between MYDOS and the XEP80 driver furnished by Atari, mentioned it on the net, and was informed that the XEP would work as long as DUP was not loaded. Well, I thought that would be OK for my plans, but realized an issue: I had no way of loading my editor package. The autorun file needed to be the xep driver; the editor would need to be loaded through the DUP menu.

I tried a few possibilities, and was starting to look at the XEP driver to include in my image (which I would prefer not to do, so that the driver can be changed without me needing to reassemble). I decided to look at MDUP, and I found the culprit - in mdup2.asm the E: vector is reloaded (naturally without restarting the 40-col display) with a comment about compatibility with BASIC autorun programs. Well I don't use these, so I removed the whole routine, and guess what!

I don't have a way to transfer files to the net right now, so if you want a copy of the modified MYDOS on disk through the mail, just reply.

> Anthony E. Wright

Just some more rambling...I still think one of the best decisions I ever made was sacing up my allowance back in 1981 to go out and buy (at a GREAT price) a 400 and program recorder for $400. This led to a $250 disk drive 2 years later, and a 800xl for $150 a year or so after that. Latest aquisitions were a $35 256k 800xl and a $50 4th USDoubled disk drive. Back in '81 I could walk into just about ANY store and find software for my machine. Today...well, you still find PD and shareware now and then on BBS'. I've seriously thought about giving up on the 8 bit a few times over the past few years, but always end up asking myself "WHY?". After all this time, it still gets the job done...

This went through another news groupa while back...

you leave one or two of the second type of alien [red?] on the LEFT
of your screen. You move your ship over to the right of the screen.
Wait for about 7 minutes and watch the aliens. If they BOTH do not
fire in a single pass... kill them both. No other alien will ever
fire on any other wave. You can also do this with one red guy, you
just have to wait almost twice as long.

Assuming that you mean "Galaga", not "Galaxian", I have done this but with
blue aliens, not red ones. (Maybe it works with red ones too, who knows?)

You can't just wait at the edge; sometimes it'll shoot a wraparound bullet
that can get you unless you dodge it.

What kind of modules do you want? Do you mean modem drivers? Bob wrote drivers for every conceivable modem. With no driver installed, it defaults to 850/P:R. There are drivers for the SX212, MPP, 1030, XM301, etc.

These should have come with the program itself.

>what kind of modules do you mean? Do you mean modem drivers? ...

No, I mean "modules" for use with BobTerm. I forget how many came with the latest version of the program, but the two I can think of were a command line processor for Sparta 3.2, and support for the XEP80. Has anyone else besides Bob Puff made any modules for use with the program? 2 that I thought might be nice are 80 column screen via software for those of us without XEP80's, and VT100 emulation. With those 2 additions to BobTerm, I'd need never use any other term program...

Hello,

I'm looking for the following:

Super Mario-Bros
Airball
Mission Impossible
Jumpman (my copy has 2 bad sectors)
^ original (as in 4-5 year old Epyx release - looks old...)
(I bought it for $5 or was it $10 from a store)
(selling out what little Atari stuff it had....)

Wico Trakball

About this stuff:

Is it still made ?
Was it ever made ?
Do you have it ? (Do you want to get rid of it ?)

Also, does anyone have a 850 field service manual ?????????

Also, does anyone have any documentation on the Chip/Archiver
(not original docs, technical specs such as the expanded commands)
Also, has anyone ever written any custom programs for the Chip ?

Has anyone tried the Super Archiver (now available from B&C) ?
How is it compared to the Chip/Archiver ?

Anyone have an Omnimon/Omniview for an 800XL they want to sell ?
How about an XL with omniview ?

Also, I heard Airball will only run on the Xls, does anyone know why ?
(my main machine is my 400, but I also have 2 XLs....the 400 is much more
quality built)

On another note, i would like to discuss with anyone out there who has
compared/contrasted the Atari ST and Amiga. Mail to me if you wish
discussing this topic with me, as I want an in depth analysis of both
machines, and some pretty specific questions answered.

Thanks for bearing with this long message.

>Karl Poorbaugh
>sl195089@silver.ucs.indiana.edu

The 16K is actually 'underneath' the operating system. Thus, accessing
it is a tricky business, since you must mask all interrupts while you
do so. Furthermore, there is a gap from $D000 to $D800 (it may be larger,
but I don't think so) right in the middle of the 16K, so you actually
have only 14K free. If you just want to use the extra 16K for programming
or word processing directly, it cannot be done because it is bank-switched.
I have seen a few ramdisk programs that take advantage of the 14K so that
you can, for instance, store DUP.SYS and MEM.SAV in the ramdrive to have
DOS load up instantly from BASIC/Assembler/Editor. I have not seen many
other uses of the memory.

Message-ID: <1990Feb7.060203.24025@uokmax.uucp>
Source record: 115150

I am fairly new to the world of modeming. I currently have an IBM here at school and an Atari at home. I just got a modem for the IBM, a Hayes-compatible 2400bps external modem. Does anyone know -- can this modem be directly connected to the Atari 800XL, without using the 850 interface or other such inteface? "Directly" includes hand-wiring an Atari SIO cable to the modem RS232 cable.

If this is indeed possible, I would assume that I would need some sort of device handler to get the operating system to recognize the new device. Is there any software available for ftp that would perform this fuction? (of course, I would be able to ftp it, but not to the Atari since the Atari doesn't have the handler software yet. I'd even get a printout of the object code and type it in manually if necessary...) Or would I need to write my own device handler? (I have written rudimentary handlers before such as miniature ram-drives and such, but I have no idea what hardware registers would be used to access a direct-wired modem.)

Thanks in advance.

Yes, this is possible. I have a Packard Bell 2400BPS running on my
130xe without any type of interface. Once you make your cable (I purchased
a Supra 1200At MOdem a while ago that came with a cable that was rs232 on one
end and ATari sio on the other) any programs that have been written for the
Atari SX212 modem will work perfectly with it (even though the SX212 is only
1200 baud most programs written for it support up to 9600 baud). There are
also a couple of pd drivers available that you can append on to most
telecommunicaton programs to make them work) The one that works the best
is SX.COM by J. Dillow

I doubt it; but there are published plans on how to use the
joystick ports to interface to the modem (RS232-wise). The
XM301 and 1030 modems are SIO connectable; but designed that way.

Either way, however, you would have to write a custom device driver
so that the Atari would correctly talk to the RS232 modem. And
getting stock programs to talk to your interface might be a bit
tricky as well, but possible.

If you are interested in the plans, I can dig into my old Antic
and Analog magazines for them.

3000. XEP80 & DOS XE

Newsgroup: comp.sys.atari.8bit
Date: 1990-02-08 01:06:00 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <9002080810.AA12038@ucbvax.Berkeley.EDU>
Source record: 115153

Is there anyone out there that uses both DOS XE and the XEP80 80-column screen? This is a fairly technical question. Under DOS 2.5, it is possible to flip between the Antic and the XEP80 displays using XIO commands 24 and 25. What I have done is created a DOS XE disk that automatically runs the XEP80.DRV program. I then go to Basic and type the XIO command to go to the Antic display. There I'm stuck - the XIO command to return to 80 columns isn't recognized. (unfortunately, I don't remember the error number right now.) However, running XEP80.DRV over again (from DOS XE) works fine. Has anyone else ever noticed this?
While I'm at it, are there other services similar to INFO-ATARI out there? I've heard there were, and if Info-Atari is going to shut down I'd like to know where they are. How is it that there's an Info-____ for MS-DOS machines that isn't too big? Are there more on-line Atarians than MS-DOS users?
Thanks.

Michael Current / currentm@carleton.edu

Source record: 115005

Hello all,

I was very sorry to see the last message in the last digest about the possible end of this group.

We can't let this happen. This is the only link that many people have to Atari owners and Atari supplies (as the ones who seem to be doing the supplying are the Atari owners....no suprise there). If I was going to be around at this university and it was accesible via the internet (which to my knowledge it isn't) I would volunteer, as I don't want to see this list come to an end.

We have very little time, so lets hope that one of us enthusiasts finds a site. If not, maybe, somehow, we could generate a list of all people who are interested in staying in touch on Atari topics, and send this list in the last few digests so that all of us can still stay in touch (albiet a little less conviently).

If it does come to and end, may I say to all of you that when I joined this group, my enthusiasm for my Atari (400, 800XL, 810 w/CHIP, 1050 USD, 850, and my Epson Printer) increased 10 fold. I have gotten several good pieces of software from people on this list, and it is the only good connection for 'discontinued' software.

Since ANALOG is no more :-(, if this group goes, that will be the end of the good times for many of us.

Thanks everybody for listening...

Connecting a standard RS-232 device is not as simple as making a cable.
The Atari SIO (Serial I/O) port CAN work as an RS-232 port, but it needs
a little help.

Further, some of the lines coming off the modem are tough or impossible
to replicate so what you normally want is a subset.

The cable that most likely came with the Supra is an R-Verter, a
commercial product. The R-Verter was a slick device that looked
like a cable, but hidden inside the RS232 end of the cale, inside
the hood, was a weel made tiny little board with a single IC.

The Atari SX212 "direct connected" to the SIO port by putting the
equivalent of this chip inside the modem. The chip isn't anything
special, just a little glue logto get the signals right.

>between the Antic and the XEP80 displays using XIO commands 24 and 25. What I
>have done is created a DOS XE disk that automatically runs the XEP80.DRV
>program.

I used DOS XE until it interacted with SUPER ARC in an "unfavorable" way. I switched to MYDOS - it has everything I need and more. Well, (re my previous posting) it had problems with the XEP80 too. Now you see why I like MYDOS - I have the sources, and can fix problems myself! MYDOS is also compatible with 2.5. Really the only thing it doesn't have is time/date stamping, which I have a way to deal with. I also may fix it at some point; the directories on DD use only half of the sector, which leaves the other half available for more information.
-Stan
(OK, I will concede that DOS XE's file map rather than linked sectors is better, especially when you delete a large file.)

3004. Atari 800 system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1990-02-09 17:22:22 UTC
From: everett@hpcvlx.cv.hp.com
Message-ID: <102110001@hpcvlx.cv.hp.com>
Source record: 115008

I have an Atari 800 system collecting dust, that I'd like to get rid of.
I'm willing to let it go to the highest bidder, with a minimum of $25 plus
shipping costs. The system consists of:
48K 800 computer and power supply.
1 disk drive (whatever the standard Atari model was in the early '80s
BASIC ROM
PAC MAN ROM
DOS
Manuals (including De Re Atari)
This is all from memory, but the last time I plugged it all together (a couple
of months ago, it still worked just fine. There's no monitor, but then all
you need is a TV, since the 800 has RF out. I AM going to get rid of this.
My den is a mess!

If anyone's interested, write, send e-mail, call.

From: markt@tekig3.PEN.TEK.COM
Message-ID: <5574@tekig5.PEN.TEK.COM>
Source record: 115009

My father has an Atari 130XE. I would like to get a copy of kermit for
his machine so we can exchange text files between my machine (IBM) and
his.

He also needs a B/W (or color) composite video monitor with sufficient video
bandwidth to work with his XEP80 80-column video card. It would need
to be pretty low cost.

Thanks!

Source record: 115011

Hi All,

I have a couple of 8bit atari's at home that my kids use for games and such, but they are getting a little older and I may be retiring the Panasonic printer from my PC in favor of a Laser printer. I purchased a used 'TRAK' floppy drive awhile back for them, which has worked well. On the back of the drive ther is a connector for another drive (looks like you need only an apropriate ribbon cable and a floppy with power supply [ie it has the electronics for talking to the Atari in the first drive] and there is a Printed Circuit board edge connection for a printer.

Has anyone got documentation on these two ports so that I could make use of them??? And for the external second drive anyone know the type of drive needed ??? (SSDD or DSDD) ....

Also I would be interested in information on capabilities of various "DOSs" and where I might collect them.

I would be willing to pay reasonable copy charges for the above documentation (unless you have a good discription that can be emailed).

Please email me direct: hays@apollo.hp.com or hplabs!hpubvwa!hpuslua!hays

What??!?!?!?

I don't think this is anything but a rumor...

There are groups in existence that have virtually NO traffic, so I don't think
that there is any near end to this group..

Besides, it would have been posted here first if the group was going to e
erased.

I for one have used this group many times to get help and to give it...

Re: MONITORS for the XEP-80 -- I have used the Magnavox "Computer Monitor 80" very successfully with the OMNIVIEW 80-column display, and I see no reason it would not do even better with an XEP-80 character generator. The bandwidth is quoted as 20 MHz, and I believe it from the sharp display. They sell for around $70 to $80 at Service Merchandise and recently have been offered at a lower price as they are being discontinued.

Re: INFO-ATARI8, fate of -- Well, perhaps we can use INFO-ATARI16 as a place to post questions in the interim, with answers sent directly to the person who posted the question, who can then summarize to all others who reply. Maybe that can keep us alive until we find another host.

Or maybe we should just use e-mail with a long list of addressees and hope that newcomers will find out how to get in touch...

Is this group coming to an end? If so, what can we do about keeping it
alive? I think that there is enough (but not overmuch) traffic in this
group to justify its existence.

What's coming to an end is the redistribution of the group to Internet
(and Bitnet?) sites via the Info-Atari8 mailing list. The problem is
not lack of interest, but lack of a host to handle the collecting up,
digestification, and remailing of messages. It was done on
Score.Stanford.EDU until last year, when Score disappeared. We then
moved to Simtel20, but they're pleading overloading, and are moving a
number of lists off that host. We've had zero luck finding anyplace
else to handle the mailing list. Unless we can find someone who's
willing to provide some machine time and disk space, and who's able to
send and receive internet mail, the mailing list will be discontinued.

Sorry guys, we've tried real hard to find an alternative, but there
seems to be none.

Someone recently posted here, quote,

"I was very sorry to see the last message in the last digest about the possible end of this group."

and more.

WHAT!?!?!?!?!?!?!

I must have missed this one, and by God I do NOT want this group to end! This is the *ONLY* nation- and world-wide network for Atari users I have ever found, and I'll be damned if I'll let some non-Atarian somewhere yank it all out from under me!

Who do I write to, who do I call, who do I pester, who do I see, to stop this dastardly event? I think ALL readers of this groupu should find out, and mass-mail the daylights out of said parties to express our desire that this group CONTINUE!

Note that I do NOT advocate irate blasting and invective- -- THAT would backfire drastically! -- but rather a polite flood of requests that any decision to terminate this group NOT be made!

Start pestering your local sysmanagers to find out who to contact about this! I'm going to.

Chris Chiesa, Atari Enthusiast, by God...

Is anyone out there interested in upgrading their atari 8bit?
By upgrades I am referring to memory expansion, changing to a 65816
microprocessor, adding multiple i/o chips, adding cartridge roms directly
to the computer, etc. If you are interested, post or send me email.
I have several text files describing various upgrades, and I'm working on a
few upgrades of my own (second PIA, lots of memory, 65816 running at 4MHz
or higher, some others...) and I want to know how many people are out there
that are interested. Also, if you are affiliated with a users group you
might want to ask members if they are interested.

Thanks
Charles_K_Hughes

In article <9002090803.AA05642@ucbvax.Berkeley.EDU>, ACSCHW@SEMASSU.BITNET (Is There In Truth No Beauty ?) writes:

>
>Hello all,
>
> I was very sorry to see the last message in the last digest about the
>possible end of this group.
>
>[Fears of newsgroup deletion deleted]

I have seen quite a few messages concerning the possible deletion of this newsgroup. I believe the cause of all this is merely the misinterpretation by the above reader (and others) of the message which started it all:

In article <9002080810.AA12038@ucbvax.Berkeley.EDU>, Michael Current (current@carleton.edu) writes:

>[Questions concerning DOS XE and the XEP-80 deleted]
> While I'm at it, are there other services similar to INFO-ATARI out there?
>I've heard there were, and if Info-Atari is going to shut down...
^^
Reading between the lines, I see a user who is experiencing the complete lack of support from Atari and most other commercial outfits for the 8-bit line. So Mr. Current makes a safe (although probably incorrect) assumption that the 8-bit Atari-related newsgroup will go the same route as ANALOG and ANTIC. Frankly, I see no justification for this, since the newsgroup gets a fairly steady, albeit low, flow of messages. I've seen other newsgroups with a much broader appeal receive little or no messages in weeks and/or months at a time. INFO-ATARI8 (comp.sys.atari.8-bit) can boast of at least one message every two or three days. Also note that there have never been any messages from any "official" source stating the demise of this newsgroup; a quick perusal of news.admin shows no reference to the removal of this newsgroup. If/when that occurs, THEN we should start making some noise.

Mike

Source record: 115021

I'm sending this again because I'm not sure if it got thru the
first time, if it did, I appologize.
In the game Alternate Reality:the Dungeon, I'm stuck. I can't
get past the Gargoyle on the 3rd level. You have to answer 3
questions in turn. And I can't even get past the 1st one. which is:
The first's simple---should take no time;
All thou must do is end my rhyme;
Not man nor beast met his demise
(To thee I'm sure 'tis no surprise);
A cruel fate ended it's trek;
Now thou stand'st 'neath a great __________.
I've also gone to the Oracle of Wisdom whcih said:
A fearsome face lurks by the Dragon's lair.
Answer his quearies for a valuable ally.
Remember "Xebec's Demise."
I've tried Xebec, Xebec's, Demise and combinations and
nothing works....help. Also some one also posted back in
April (I think) saying that they had gotten a program to
edit the stats of your character. If any has that program
could you please send it to me.
Next:
I've been looking at some of the earlier digests and seen
talk of a way to transfer files between a PC and Atari. Is this
possible? and if so could some one tell me where I can get the
program. I have an 800XL, 1050, MPP1000e (modem), XEP80. None of
which is modified.
Next:
I would hate to see this list go under. I've been able to solvesome
problems with information from this list. I've seen so many sites
that have an over abundance of space for other computers and we
have trouble with keeping the only space for the Atari open.
Something seems pretty unfair here.

Message-ID: <9002130809.AA20052@ucbvax.Berkeley.EDU>
Source record: 115022

Hello again,

Since it looks like the list will be discontinued, anyone wishing to stay in touch, please mail your net adress to me (and the net you are using, should this message get beyond BITNET) and I will compile a list and then if you also want, I can send you this compiled list after it is completed. Please, if you want to keep in touch with everyone, a list seems to be the only way to go (unless we get really lucky and find another site).

Mail your network mailing adresses to:

ACSCHW@SEMASSU

If your not on bitnet, and can't seem to get through, a friend of mine on a Unix machine mails through GARP at MIT, and UCBVAX at BERKELEY

Also, can anybody tell me where I can get the IBM program that write files on an IBM floppy in MYDOS format. Also, I'm going to need MYDOS (and would also like the sources). If anyone has these, let me know. It would be easier than using a modem and downloading (since I can't afford the long distance call to my school....well, not can't afford it....don't want the ridiculous bill..... :-)).

I have found more Atari enthusiests here than anywhere else, please send me your net address if you want to keep in touch, and I will send out the list to you once it is made (if you want it)!!!!!!

Thanks again for listening,

I just bought a new television. It has a jack for direct video input. I would like to connect my Atari 800 to the television using that input.

I have a cable that I used for that purpose years ago. One one end, the cable plugs into the Atari 800 monitor jack. The other end has 4 outputs that look like standard audio/video connectors. They are yellow, black, white, and red.

The only two which give any results are the yellow and black ones. The black one works perfectly, it sends an audio signal to whichever audio input I attach it to. The yellow one does send a video signal to the television. But the picture is in black and white and appears to have other problems as well. I know it worked perfectly, years ago.

Any ideas?

-Bob Rothschild roths@dg-rtp.dg.com

Source record: 115023

Hi guys....

I have several text files on various upgrades, I will edit them and then post so that you can use them.
Most of my files are on memory upgrades, I am working on several upgrades myself. Things like: 65816 running at 4MHz (if I succeed, then getting it to run at 6MHz will be a piece of cake), high capacity ROMS (so I can stuff BASIC XE, MAC65, and other various programs all on one rom and stick that inside my computer), extra I/O chips (PIA upgrade is done, an ACIA is planned), extra I/O ports such as the 2 missing joysticks, a true RS232, a parallel port (for a printer), maybe even a disk drive controller so that we can use those nifty IBM drives. :)
It will take some time for me to finish all these, and it may prove to be impossible in some cases, but as soon as I succeed (or permanently give up) I'll post.

The first upgrade text should be posted by the end of this week. It is a PIA upgrade so that you can control memory uprades better.

Charles_Hughes@cup.portal.com

btw...if you have any upgrade texts, please send them to me, I collect them.

The yellow one seems to be the Luma output. On certain monitors (like the
Commie 1702) you can have the Chroma (color) and Luma (brightness) inputs on
different plugs, which gives a better picture. It sounds like your cable might
be messed up, or possibly a connection to the jack in the computer.

3024. Pending demise of newsgroup (was: Something has to be done...

Newsgroup: comp.sys.atari.8bit
Date: 1990-02-13 02:21:47 UTC
From: DAVISM@kcgl1.eng.ohio-state.edu
Message-ID: <4214@quanta.eng.ohio-state.edu>
Source record: 115024

Apparently, only the INFO-ATARI8 side of the "newsgroup" will die.
How this affects the actual newsgroup (as opposed to the mailing list)
comp.sys.atari.8-bit, I don't know. (Explanations anyone?) It does seem
a good idea to inquire of the "powers that be" concerning the possible
demise of comp.sys.atari.8-bit, which I understand has already been performed.
In my last message, I made a statement concerning how comp.sys.atari-8-bit
would go the way of ANTIC and ANALOG; suffice to say that ANTIC has a ways
to go before it suffers the same fate as ANALOG. I'm sorry for any confusion
this may have caused.

Mike

P.S. Thanks to Michael Current for forwarding information to help me
straighten things out for myself.

3026. 3 1/2" disk with 400/800/800xl

Newsgroup: comp.sys.atari.8bit
Date: 1990-02-13 21:33:00 UTC
From: ACSCHW@SEMASSU.BITNET
Message-ID: <9002170348.AA13839@ucbvax.Berkeley.EDU>
Source record: 115029

Hello,

Has anyone ever hooked up a 3 1/2" drive (720K or other) to an Atari 8 bit ?

I would really like to do this to save space and use more reliable disks.

Someone told me you can hook up the old Percom DSDD drive to a 3 1/2" unit
and it would work (although, they had not done it to prove that...)

Would that work, how are the old percom units as DSDD 5 1/2" drives ? Are
they more reliable (I haven't had too many reliablity probs, but...)

I am very interested in doing this, but would like someone to tell me how
to do it (please don't tell me to buy a XF551 drive...I can't justify the
expendature...unless you got one for sale cheap...)

Thanks again,

>one works perfectly, it sends an audio signal to whichever audio input I attach
>it to. The yellow one does send a video signal to the television. But the
>picture is in black and white and appears to have other problems as well.
> .....

I think I know what's happening (any 800/video gurus out there care to confirm
and/or correct the following?):

First: the 800 has (at its monitor jack) composite video
(NTSC, at least in the USA) output and audio output. (I used to only have
an 800 but it's cost-to-repair got too high, so off to K-Mart for a $99.95
800XL.) I think that the audio is the same pin (on the DIN jack/plug) for
all the 8-bits, if so that explains why any 8-bit-Atari-compatible monitor
cable will give you audio.

Second: Your video cable sounds a lot like one that has,
instead of _composite video_, what I call "split chroma/luma" video. The
"luma" [luminance] signal [same idea as Graphics "luminance"] is brought out
separately from the "chroma" [chrominance] signal [same idea as "hue" I think].
This kind of cable is what us 8-bit users who have a 130XE (I don't know about
the 65XE, but I don't know anyone personally who has one) or an XL with the
chroma signal brought out (a simple h/w mod.) use to see the highest-resolution
COLOR display that those computers can put out (using a monitor like the
Commodore 1702 or 1802, Technika[sp?] <whatever-model-#>, etc.).
The only flaw here is that your cable has _four_ plugs. Maybe one of them is
supposed to be composite video; but if so, and if the connection was good
(and the cable is wired properly - sorry but I don't have the 800's pinouts,
at least not here at work), you should be OK.

Third: Your Atari 800 (as you may have inferred from the above) _does not_
put out split chroma/luma (unless it has been modified to do that, much more
complicated than for an XL I think). So again, you need a cable for plain
vanilla composite video. (These used to be available at any 8-bit-anything
computer dealer, even like discount stores...)

I hope this helps!

I have the file and the source (in C) that I will uuencode and upload for all. It requires a Double Density drive on the Atari though. I've used it on numerous occasions, and its worked just fine for me.

Just a couple of questions about MYDOS (since I've heard lots of Good Things about it) ...

1. Is it PD or shareware, or a regular commercial product?

2. If the former, is there an FTP site for it? Or, if the latter, do you know who distributes it, and what it costs?

Thanks in advance!

Max J.

3030. Connecting Atari 800 to a video input

Newsgroup: comp.sys.atari.8bit
Date: 1990-02-14 23:55:00 UTC
From: CURRENTM@CARLETON.EDU
Message-ID: <9002170529.AA19885@ucbvax.Berkeley.EDU>
Source record: 115034

In the article <13178@cbnewsd.ATT.COM> Nick DiMasi gives an explanation of the chroma and luma outputs of the Atari XE's. What I found surprising to read was that the 800 has no split chroma/luma output. I've always had the general impression that every XE/XL/800 EXCEPT the XE Game System has the separate video outputs, including my 130XE and my family's 800. Maybe somebody else can confirm this. I believe that all but the XE GS have five outputs at the monitor jack: audio, composite video, composite chroma and composite luma. (And the XE GS has just audio and comp. video.) To address the original question, I agree that it sounds like the yellow connector is the luma, and the black obviously the audio. Either the white or the red should be the composite video, which is what we're after.
Hope this helps. -Michael

Hello,
I am planning to hook up a Hayes compatible modem to my 800XL.
However, I do not know what the pinouts are for the serial port
on the interface I am using (it's the 850 or the 825, I forgot;
the old interface that came out along with the 400/800 line).
If anyone has the documentation for the interface, or knows
what the pinouts are, I would greatly appreciate your help.
Thanx.

> How this affects the actual newsgroup (as opposed to the mailing list)
> comp.sys.atari.8-bit, I don't know. (Explanations anyone?)

It affects comp.sys.atari.8-bit not at all. To my knowledge, there has not
been any proposal to issue a rmgroup for this newsgroup.

I try to keep a close eye on news.admin, news.sysadmin and
news.announce.newgroups. (I dropped news.groups during the alt.fishies
flame wars, so almost anything could be there and I might not know about
it.)

It may be that the number of systems carrying the group is shrinking
because system administrators don't think it's worth carrying, but that's
another matter. No site is ever forced to carry any newsgroup.

[ACSCHW@SEMASSU.BITNET (Day Of The Dove) writes ...]

Again, the problem seems to be related to BITnet lists, and not to the
main body of Usenet. Messages like this are quite confusing to those of
us on the non-BITnet side of the fence. Come to think of it, BITnet itself
is confusing from this side. Maybe from that side, too. :-)

3033. Re: Connecting Atari 800 to a video inp

Newsgroup: comp.sys.atari.8bit
Date: 1990-02-18 01:40:35 UTC
From: mjw06513@uxa.cso.uiuc.edu
Message-ID: <49700010@uxa.cso.uiuc.edu>
Source record: 115038

From p. 237 of "Mapping the Atari" (XL/XE edition):

Here are the pinouts on the 800 and XL/XE's monitor jack:

1 - Composite luminance
2 - Ground
3 - Audio output
4 - Composite video
5 - Composite chroma

Looking at the back of the 800, the pins are arranged like this (pretend the V shape below is really a semicircle):

3 1
5 4
2

My 800XL feeds the composite video input of my TV just fine using pin 3 for audio and pin 4 for the video.

Hope this helps.

3034. 800XL and S-video?

Newsgroup: comp.sys.atari.8bit
Date: 1990-02-18 01:40:40 UTC
From: mjw06513@uxa.cso.uiuc.edu
Message-ID: <49700011@uxa.cso.uiuc.edu>
Source record: 115039

On a topic related to the recent 800 video output discussion:

Has anyone out there tried to hook up their Atari to a TV or VCR with "S-video" inputs? Since the Atari has separate luma (Y) and chroma (C) outputs, and the S-video input is nothing more than separate luma and chroma in a tiny DIN-type jack, it seems like it should be possible to run the output of my 800XL into the S-video inputs on my S-VHS deck and get better quality pictures. If anyone has tried this, I'd like to hear about your experiences.

Earlier someone mentioned that a hardware mod was required in order to get the separate luma/chroma outputs to actually appear on the 800XL's video output jack (unlike the original 800, which supplied these signals in the standard configuration). Can some kind sould out there post or email the details of this modification? I would like to experiment with the separate Y/C output.

Thanks in advance to all who can help.

3035. Re: interf help needed.....(850 RS232 port pinout)

Newsgroup: comp.sys.atari.8bit
Date: 1990-02-18 04:57:06 UTC
From: rfc@briar.philips.com
Message-ID: <81671@philabs.Philips.Com>
Source record: 115037

here's the pinout on the 850 interface port 1:

pin 1 DTR
pin 2 carrier detect
pin 3 send data (out)
pin 4 receive data (in)
pin 5 ground
pin 6 DSR
pin 7 RTS
pin 8 CTS
pin 9 nc?

I usually use only pins 2, 3, and 5, and use Xon Xoff.

Did you know? That when you buy something "made in China", something like half the money you pay goes to the Chinese government. The same government that did Tiananmen Square last June. Don't think I'd want to give them any money, not after that. Don't worry about putting workers over there out of work, they get paid even if there's nothing to do. Or so I've heard.

3036. XEP80's

From: cs.umn.edu!thelake!steve@ub.d.umn.edu (Steve Yelvington)
[...]
Again, the problem seems to be related to BITnet lists,

No. As has been explained before, it's the Internet mailing list that's shutting down. The Usenet newsgroup is maintained by whoever maintains such things, same for BITNET or any other places to which these messages get redistributed.
and not to the
main body of Usenet. Messages like this are quite confusing to those of us on the non-BITnet side of the fence.

We've tried to be very clear about what's what. The Internet mailing list "Info-Atari8" (and Info-Atari16) is shutting down. It's due to lack of a host on which to do the processing of messages, not due to lack of interest. The Usenet, Bitnet etc lists are not directly affected by this, just recipients of the Info-Atari8 mailing list.

Hope that alleviates the confusion.

3039. ATR 8000 HELP NEEDED!

Newsgroup: comp.sys.atari.8bit

Source record: 115044
Cross-posted to: comp.sys.atari.8bit,comp.sys.misc,comp.os.cpm

I recently acquired a ATR 8000 system w/ a 64k Atari 800. This system is a CP/M 2.2 system with a special interface allowing it to be used as disk drives for the Atari and as a CP/M system using the Atari as a terminal.

My problem is that I can't get it to boot. I've got two 8-inch drives and one 5 1/4" drive hooked up.

The drives come on when I hook up the power, but all I get on the Atari is a BOOT ERROR message. I've gone through the manual, checking to make sure that I have the drives configured correctly. The 8 inch drives are on the "end" of the drive cable. I've got the 5 1/4" drive configured as drive 1 and the 8's as 2 and 3. I've got several boot disks, but I can't get any of them to do anything but give me a BOOT ERROR.

Any help would be apperciated. Is SWP products, the manufacturer still in business?

XEP80's run at around $80 through mail order, don't they? I bought a used
one through the net for $40. I would guess that the guy with 5 would probably
take $40 or $50 (forgot the name).

I think that the Atari is missing something at 40 cols. I think 80 cols
almost makes it a computer (now all I need is a hard disk or ramdisk...
sigh). Software would be the issue. Any program that dosn't conflict
with the driver (in memory), that does standard I/O to the E: device should
work. My editor, which simply repaints the screen with any change doesn't,
so I am in the process of rewriting it (and am including many other features
as well). I think it is a great addition. The XEP80 includes a parallel
printer port, which I haven't needed or used yet.

Oops, I goofed on the 800 this time (I don't even have one anymore). But I'm pretty sure about the 800XL not having chroma output - at least, that is what I've read (in this newsgroup among other places), and _my_ 800XL does not have chroma (unless it comes out on a strange pin - the pinouts for the 800XL and 130XE are supposed to be the same, except that the chroma signal isn't really there).

I'm still looking for the info on the 800XL chroma mod. (I know I have it on a tape, but I have yet to try reading that tape over here ...) If someone else has it handy, please post/mail it - meanwhile I'll keep looking (at least one 8-bitter out there asked me for it). As I recall, it is mostly (if not entirely) the addition of a proper resistor between something (a transistor?) on the board and the output pin...

Oops, too bad this "reply" function won't let me fill in a Subject..

For Ronnie Hughes: IDC's phone number is... (815) 968-2228 (voice).
BBS number is 968-2229 and fax is 968-6888

Address is 1220 Rock Street, Rockford, IL 61101-1437. Info accurate as of December 1987, hope it's close enough. -=-=-=-=-=-=-=-=-=-=-=- For Nick DiMasi and others, info on 800XL chroma mod and whatnot.

Mapping The Atari, Revised Addition, page 237, shows the connector pinouts for the "800 and XL/XE's" as follows:

Audio output 3 1 Composite luminance

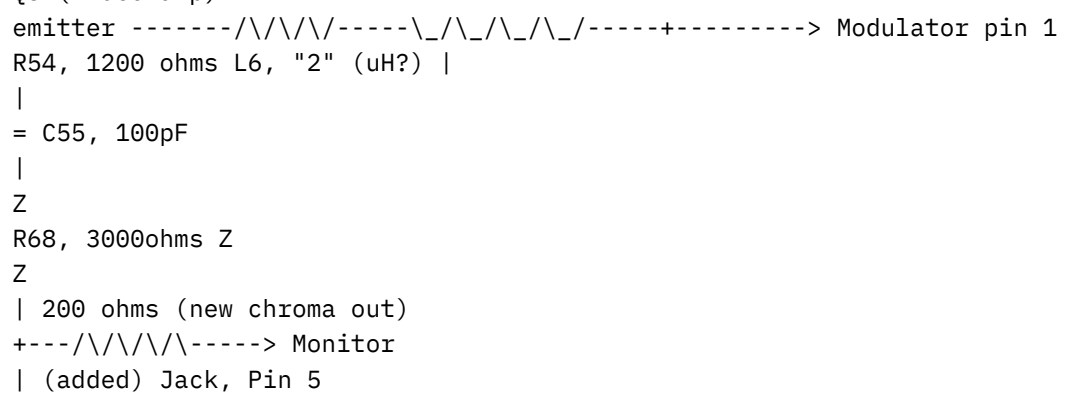
Composite chroma 5 4 Composite video

2
Ground

The "notch" in the connector is at the top, opposite pin 2 (ground).

In actuality, Composite Chroma is NOT brought out in the 800XL, and presumably also not in the XE series. The mod that was posted, which I think comes from the Feb. 1986 issue of ANTIC, shows a 200-ohm resistor brought out from the junction of the existing R67 and R68 to pin 5 of the monitor jack. For those of you who don't have the whole schematic committed to memory, R68 is a 3000-ohm (orange-black-red) resistor which is coupled by C55 (100pF capacitor) from the video amp (Q3) output where it connects to the modulator at pin 1. R67 is a 75-ohm re- sistor which leads from the color amp (Q5) out through C54 and L7 to the composite video output (monitor jack pin 4).

Here's an attempt to render the diagram. Turn on your PostScript interpreters...



```
| Q5 color amp |
emitter ----------------------------------+---/\/\/\/\--||--- - -
R67 C54
75 ohms .001 uF
```

I'm not entirely certain why the resistor value chosen was 200 ohms. If you are driving 75 ohm cable with it, you might find that the picture is sharper if you use something in the vicinity of 47 to 75 ohms. I'd try 47 or 56 ohms myself, to give as close to 75 ohms source impedance as humanly possible. HINT: emitter followers at low frequencies exhibit an emitter output source impedance of around 26 ohms at room temperature. Add that to the resistor value to get a rough idea of your actual source impedance.

Incidentally, I thought I sensed some confusion out there. The output that the Atari 8-bitters provide (incl XL/XE with the above mod) is your choice of composite video, composite luminance, or separate chroma.

Composite video is made up by combining chroma and luminance signals and putting the chroma in at the color subcarrier frequency of 3.579545 MHz. The signal is "double sideband", and the lower sideband falls well down into the band occupied by the luminance signal, which starts at DC and extends upward. If you could let it go up to 6 MHz or so, you would have REAL SHARP picture resolution. Obviously, with color stuck in there, you have to do something to limit the bandwidth of both luminance and chroma signals so they will not spill over and interfere with each other. Actually, there is a bit of black magic to it, and the system actually has been made to work better than theoretically possible, sort of like the bumblebee or the analog magnetic tape recorder, neither of which can possibly accomplish what they do.

Anyway, by keeping the luminance and chroma on separate wires, you don't have to limit their bandwidth, you can preserve it and have an incredibly sharp picture.

What any monitor must do, however, is to take the chroma and the luminance signals and "decode" them, using, typically, a chip called an "NTSC Decoder". (NTSC, of course, stands for "never twice the same color".) An RGB monitor, on the other hand, expects the decoding to have already been done for it. To hook an RGB monitor to an Atari 8-bitter, you must supply your own NTSC decoder circuit, to convert the composite chroma and luminance into the R, G, and B signals.

According to a cousin of mine who is both an Atari 800XL fan and the chief engineer of WAAY-TV in Huntsville, AL (and also a former professional video special effects equipment designer), if you buy an off the shelf NTSC decoder chip and hook it up in the obvious way, you will likely run afoul of some funny "matrixing" that is done in the chip which will give you slightly incorrect colors. Apparently the tubes used in TV sets want something other than pure R, G, and B signals, and that's what the typical chips give them -- something other. My cousin says that the right way to build the device you need is with separate

balanced modulator chips and some fine-tuning adjustments that will let you balance the colors correctly.

If anybody REALLY wants to build such a device, I will put you in touch with my cousin and a friend who I think built one under his tutelage.

-=-=-=-=-=-=-=-=-=-=-=-=-=-=-

Finally, the joystick ports... whew, had to sweat a little to find this, it is on page C-1 of the 400/800 hardware manual.

1. Forward Input 6. Trigger Input
2. Back Input 7. +5 Volts
3. Left Input 8. Ground
4. Right Input 9. "A" Potentiometer input
5. "B" Potentiometer input

Physical layout looking at the jack 1 2 3 4 5
o o o o o

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale

Stan:

Thanks for your input on the XEP80. I have a few questions about 80 column drivers:

- Can the XEP80 display crisp 80 column text on a 13" color TV?

- Can the XEP80 display ATASCII graphics (the ATASCII character set) On a mono/amber screen monitor? (Or if I were using an XEP80 with a mono monitor, would I need to use ASCII translation when modeming?)

- There is a PD 80 column driver I am sure you have seen that sets up 80 columns o the screen. But this won't work with, say, BOBTERMwill it? Upon loading of BOBTERM wouldn't the 80column handler cause some sort of crash??

Thanks!!

Hello Fellow Atari 8-bitters:

I would like to ask for some help on an upcoming demonstration I have been asked to conduct. This Wednesday night, between about 7p.m. and 9p.m., I have been asked to demonstrate the VT10 Squared vt100 terminal program at the monthly meeting of Houston Atari Computer Enthusiasts (HACE).

I would like anyone out there that has BITNET access, and is willing to help, be available on RELAY Channel 800 between 7 and 9 central time. I am mostly interested in showing them the wide area the network covers, so I will have more interest in talking to someone outside of Texas, over someone inside Texas.

Please send me a note by E-mail if you are interested in participating.

Thank you,

Alvin Carley

OOps, the schematic diagram (for the chroma output mod) appears to have
been OK except that you should add a Carriage Return just before# the
label "Q5 color amp", which should have appeared on the next line, over
at the start of the line, which is the signal from the emitter of Q5.

Magnavox makes a nice one called the Computer Monitor 80, which you may still be able to find at Service Merchandise and such places for around $70. However, I think it has been discontinued so you will have to find one still in stock. I recommend the amber screen for best results except when playing "Frogger", for which of course green is better!!!

In article <27342@cup.portal.com> Metalist@cup.portal.com (Bryan Jones Woodworth) writes:
>- Can the XEP80 display crisp 80 column text on a 13" color TV?

Not normally. Regular TV's don't have the bandwidth. Some say a good
B&W can be used, but I haven't tried; there's no place to plug in the
[unmodulated] composite video signal on mine. :-)

Now I use both a "mid-res" color monitor and a hi-res mono; the color for
games, and the mono for development. The mid-res has composite and TTL
input. When I attempted to use the mid-res for the XEP, it resulted in
bad overscan; apparently, real monitors have a different scan setup or
picture size or something.

>- Can the XEP80 display ATASCII graphics (the ATASCII character set)
>On a mono/amber screen monitor?

Yes. The XEP has the ATASCII character set (in ROM I assume) internally.
It supports reverse video as well. I wonder if it is possible to write
the character ROM (that is, put a new character set on RAM and point the
internal processor to it, like you do in the Atari).

>(Or if I were using an XEP80 with a mono
>monitor, would I need to use ASCII translation when modeming?)

I don't know. I have never used a modem on an Atari. It seems to me
though that a modem program that uses software 80 col would need to be
changed to simply write characters to E:.

>- There is a PD 80 column driver I am sure you have seen that sets up 80
>columns o the screen. But this won't work with, say, BOBTERMwill it? Upon
>loading of BOBTERM wouldn't the 80column
>handler cause some sort of crash??

I believe the software-only 80 col emulators set up the screen in
bitmap (graphics 8 in BASIC-talk) and do blts to form characters in a
4x8 cell. I never had a tube good enough to display this kind of
resolution, including the mid-res one. You might not get a crash; I
suspect you'd get a blank screen, because the XEP driver turns off the
graphics chip.

Get a copy of "Mapping the Atari" by Compute! Books. Make sure it is the revised copy. (It says revised on the cover).

It has a section that gives the pinouts for the Parallel bus.

How to use it is a different matter. If you have some electronics experience, it isn't too hard, if you don't then I would suggest giving Antic (the Atari magazine, NOT the amiga, or fantasy mag) a call and asking them which issues they ran the PBI (parallel bus interface) articles in, and then ordering them.

You could also just send mail to me with specific questions, I might not be able to answer them, but I'll sure try.

>how to make it do it?

Well, I don't know of any books. The standard info available (at one time?)
from Atari was the Operating System Reference Manuals which are only specific
to the 400/800 series.

However, if you have access to back issues of Antic Magazine, they ran a
multipart series on some uses of the parallel bus (the PBI - Parallel Bus
Interface). I have the March 1985 issue that describes a serial port
project. The author of the series was Earl Rice, "the project leader for
the planned top-of-the-line 1450XL[D] computer."

For those of you who don't remember, the 1450XLD had the works: built in
300 bps modem (later used (I think) in the 1030 modem), voice synthesizer,
built in _parallel_ DS/DD diskette drive. There _were_ a few made, since
Video Express in Columbus, Ohio sold about five of the motherboards. A
friend of mine built himself a power supply and is the owner of one of
the strangest 8-bit machines (sans built-in disk drive) that ever (almost)
existed.

I beg to differ! Sitting behind my 800xl at home is ICD's MIO board. This nifty little gadget (which I believe is still sold and supported by ICD) provides 256k (or 1Meg) of ram for use as BOOTABLE ramdrive(s), printer buffers, etc. as well as a SCSI/SASI disk port, RS232C serial port (looks just like R1: on the 850), Centronics parallel printer port (again, just like on the 850) and has a place for putting in ICD's 80 column board (I don't have this :-( ). Also, although the name escapes me, there is another company that put out a hard disk system that ran from the parallel port.

The other company is Supra, I have a Supra Hard Disk Interface
attached to the port. However Supra no longer supports its, they sold the
rights to the product to another company. I dont know the name of it off hand.

From: harrington@mfgmem.dec.com
Message-ID: <925@ryn.esg.dec.com>
Source record: 114976

A couple of weeks or so ago, I sent out a message saying that I was looking for the game _Bounty Bob Strikes Back_ from Big Five Software. Well, I was fortunate to find someone willing to sell me the game from their personal collection. However... they no longer had the instructions for the game.

Not that it's a hard game to figure out - especially if you've played its predecessor, Miner 2049er - but having the instructions probably WOULD make some parts of the game a little easier. So, I was wondering whether there was anyone who'd be willing to share their instructions with me. I know that there are some people on the net who have the game - they e-mailed me - but I didn't keep their net addresses. If those people would send me another note, I'd appreciate it. And, of course, if anyone else out there has the instructions - maybe someone who *didn't* respond to my previous message - I'd like to hear from you, too.

At the least, maybe someone could answer these questions:

On the Options page, what does it mean when you enable/disable the "Secret Messages"? I haven't seen any secret messages. Are there really some to be found? If so, where?

Also on the Options page, what is the significance of the "Special Codes"?

Lastly - but most importantly - is there any way to go directly to a given level? In _Miner 2049er_, you could go to the level of your choice by 1) typing in the phone number for Big Five Software (as seen on the first screen of the game), then 2) typing <Shift-level #> (or something like that). Can you do anything similar in _Bounty Bob Strikes Back_?

As before, any help that anyone can give me is much appreciated.

Thanks!

Howdy folks!

Interested in buy or selling used computers?

A new magazine is now available as a "shareware" subscription
for the buyer or seller of used/surplus computer and electronics
equipment. The free subscription is offered on a trial basis
for promotional purposes.

The Used Computer Locator is a nationally distributed magazine
for the used computer market. We are reaching users, distributers
schools, universities, and the business world.

For a short time I will offer some free ads.

To readers of the "comp.sys..." groups I will offer 5 classified
ads for each ".sys" group to the first five respondants to this posting.

Please note that if you are a business we will with proper qualifications,
offer some free ads for you also. Call me for further information.

All ads must come by email to me Ken Wilkinson Editor-in-Chief
at {wilk@cinnet.com} or! by fax at (513) 751-6463.

Remember to include an address to mail your copy, and include in
the ad your name and number to be reached.

The ad size is restricted to one (1) column inch, about 35-40 words.

The sections that ads can be appear in are:

Buyers Market
Surplus Electronics
Software Market
Networks, Systems and Mainframes
Wanted Ads
$500 Marketplace

==========

Interested in a free trial subscription?

Email me your full address (US Mail address please!)
and I will put you on the subsription list for the April issue.
Include your telephone number if you wish to be called

for advertizing information.

For any other help I can be reached at the following:

Thanks!

RE: does the XEP 80 work on all Atari 8-bits?

Yep, it sure does. In fact, that is the biggest problem with it. If Atari had made a version that connected to the parallel bus on the 800xl/600xl and 130xe machines, the XEP80 would have been the saving grace of the 8-bit line. Alas, they did not, but they did make it compatible with all the 8-bits by simply using a joystick port. Of course, they also made it compatible with any other machine with a compatible joystick port...

3078. Problem with AMAC

Newsgroup: comp.sys.atari.8bit
Date: 1990-03-06 15:22:50 UTC
From: slackey@bbn.com
Message-ID: <53063@bbn.COM>
Source record: 114982

I have been using AMAC quite a lot lately, and have determined that there is a bug in it. I know about the one where it sometimes doesn't find the macro name for a symbol after a label; I put a : after each label, and made that one go away. No, this one is more subtle; it actually silently generates bad code. I am sure of this, as I inserted a few NOP's here and there and the problem went away.

If you know anything about this, you may be the one person that reads this that can help. Please respond; for nearly all my technical questions I ask on this newsgroup, I get no response. For most of the others I have found work-arounds, and I probably will for this one too, but ANY help is greatly appreciated. Even the most insignificant-seeming idea could save me a tremendous amount of time.

I am developing something for release, I think lots of people can use it.
-Stan

> columns o the screen. But this won't work with, say, BOBTERM will it? Upon
> loading of BOBTERM wouldn't the 80column handler cause some sort of crash??

I just set up my configuration for BOBTERM this weekend. It seems like an
excellent program (V1.1) and Bob Puff will definitely get my shareware check
by the weekend.

If you are using Version 1.1 of BobTerm, it allows you to add modules that
give you extra capability. This is supposed to be new for V1.1. I did not
see V1.0 or earlier so I can't say. Anyway, one of the modules that came
with the disk I got from our users group library is a module to allow you
to use the XEP80 with BobTerm. I didn't try it because I don't have one,
but it is available. Might be just what you are looking for.

Thought for the day - if you are in active development, at this point
that makes YOU one of the experts with the answers.

I have compiled probably ten thousand lines in AMAC and never had a
compile time error. Either I was just lucky, or your bug is obscure.
Of course, that could be wrong. I never had the compiled program not
work, whether it was byte for byte what the source code said is a
different issue entire.

Has anyone else noticed that AMAC really begs for a hard drive? My guess
has always been that Old Atari Eng. had a hard disk in development and
AMAC's flavor (ever try and use it on a floppy, single-den no RAMdisk?
It was all there was for a looooonnnngggg time) came from the fact that
it was used in-house.

After you complete a given number of levels (I think it's 4), you will
be given a secret code. This code, when used in the right place, will
transport you to a higher level. That way, you can go directly to level
5 instead of going through the first 4.

Which opcode is causing the problem (or is it the operand that's getting messed up)? If it's the opcode, you might be able to get around it by replacing it with the equivalent byte (i.e. .BYTE opcode) followed by the operand (which is either 0,1, or 2 bytes). For example if CPY #LABEL is the problem, you would look up the code for CPY immediate and use .BYTE opcode, and on the next line you'd put .WORD LABEL.

I remember reading in Analog a long time ago that one of the assemblers didn't handle CPY #x properly (I forget which instruction it was exactly).

In any case I would consider getting another copy of AMAC (maybe you have a bad byte somewhere on your disk), or better yet, change to MAC/65, which I use regularly, and I wouldn't consider using anything else. This thing is able to compile >15,000 line programs (I know, I've been writing Kermit-65 version 4, and version 3 was >400K of source! By the way ver.4 is pretty much complete). I don't know how you can stand working with a program (AMAC) that doesn't work right. Programming is hard enough without having to worry about your assembler generating wrong codes!

This I'm not sure of; perhaps 75% of my code is buried in macros. Related
to the problem, you suspect? Me too. If I get to it tonight, I plan to
get a listing of the bad section with macros expanded (want to bet that
makes the problem go away? :-)) and start to zero in.

>I remember reading in Analog a long time ago that one of the assemblers
>didn't handle CPY #x properly (I forget which instruction it was exactly).

Good input. I may be doing some of these; I'll check to see it there
are any in the bad spots.

>In any case I would consider getting another copy of AMAC (maybe you have a

Me too! That's what's so weird about it. So far, it has shown up in
two (2) places! Maybe it is one of my macros, using some kind of obscure
sequence. I will look for any similarity between the two parts that
failed.

>Has anyone else noticed that AMAC really begs for a hard drive?
>ever try and use it on a floppy, single-den no RAMdisk?

OK I'm a caveman but that's all I have. Well I do use an XF551 which speeds it up some, but yes I sure wish I'd gone the extra $50 for a 130XE instead of a 65XE, for that frizzin' ramdisk. Too late now.

I will post anything I find out. Keep those email messages and postings coming!
-Stan

3086. XEP80

Newsgroup: comp.sys.atari.8bit
Date: 1990-03-06 21:50:30 UTC
From: UCI144@URIACC.BITNET
Message-ID: <9003070829.AA03656@ucbvax.Berkeley.EDU>
Source record: 114990

Yes the XEP80 does work with the 800XL, I have an XEP80 that I bought about a year ago and really haven't used it that much. I was hoping to use it with my modem (MPP1000E), unfortunately I couldn't becuase, they both use the joystick ports to communicate and I guess the XEP80 had preference over the modem. I've seen solved the problem of trying to have 80 columns with my modem, by getting K65 wich supports 80 col. The only software I've seen for the XEP80 is AtariWriter 80. If any body out there know of any other programs for it could you please let me know. Also, what can I really use it for, seeing I haven't played around with it for more than about 10hrs.

Atari did not make XEP80 connect to the joystick port because they wanted to be compatible with the old Atari, they did it because their 65XE did not have a parallel expansion port, neither did the XEGS. Otherwise, we might have been seeing good, fast 80-col now.

OK! You opened the floodgates for insignificant-seeming ideas!
I, for one, believe that ANY news is GOOD news in SOME groups where the
traffic flow seems too low for my interests, so I'll throw in 2 cents!

First off, I have just a little experience on AMAC, so I can only
suggest that you may be encountering a rare but bad assumption
concerning 6502 programming in general. A book by "Leventhal" on
6502 Programming has a good section on "Common Programming Errors"
that I have found invaluable.
A couple of glimmers through the fog of my memory:
There is some problem with indirect jumps on the 6502 if the address
crosses a page boundary (specifically, it doesnt work right).
There is something unusual about the brk instruction... I think
it pushes the Program counter PLUS 2 on the stack, so you might need
to stuff in a nop or something after a break?
Another possiblity that I have encountered on other assemblers is that
they support the 6502c, and if you use 6502c instructions, they assemble
them OK, but your target CPU may not understand these and punt.
One problem that troubled me for hours recently...perhaps a SYNTACTICAL
one! I said "TXS" where I meant TSX! That was tough to debug!

Finally, if you have the resources, and have not tried it,
you could of course, check this code out on another assembler.
However, if any of my above statements is interesting and it inspires you
to broaden your vistas on 6502 programming...why, your life will be
generally heightened! On the other hand, if any of my statements is
false (I do not attest to these), perhapse more responses on the net
will heighten MY life! What a country!

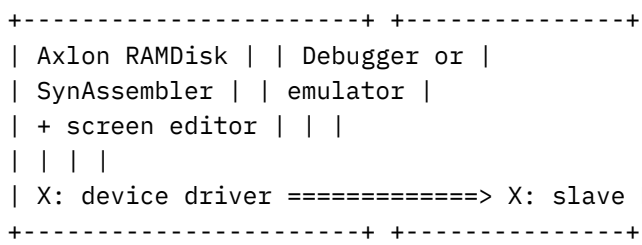
No. Actually we used Data General MV/8000 ("Eclipse") minis, and ran AMAC as a cross assembler. Pretty fast turnaround, except for the 9600 baud downloads. At night, turning a 16K game around took about five minutes. During the day ... forget it.

[I once tried to use AMAC on a 32K Atari 400 with a single 810 ... and went back to using the Assembler/Editor cartridge. Whoof!]

I wrote twenty or thirty thousand lines of AMAC before moving on to more powerful and more obscure assemblers, and never ran into any serious problems. But it is likely that the in-house version of AMAC had some bug fixes that did not make it to customers. The Atari consumer engineering department was like that -- basically clueless as far as customer support was concerned.

One of the better (faster) development systems I've ever used was a two machine setup that Jack Palevich and I whipped up one summer:

Development 800 Target 400/800 (slave)



The two 800s communicated with a two-wire or ten-wire cable hooked to both systems' joystick ports. The protocol automatically adjusted for the number of wires present -- downloads were faster with more.

We used the Synapse assembler because it was fast, and we'd written a simple Emacs-style screen editor so we didn't have to deal with line numbers. It's amazing what you can put up with (no macros, no operators other than '+' and '-') for the sake of speed.

The SynAssembler could direct the object code to any file, so by resetting the target system, and then assembling to the 'file' X:, the code was automatically downloaded and run. We got "one-button" five or ten second turnaround time, and the development system never, ever crashed.

This was in 1983. A year ago I dragged all my 8-bit equipment out of the closet and tried to make it work. The RAMDisk was dead, the 810 wouldn't read anything, and the screen was too small. But it was fun while it lasted.

Source record: 114996

Re: Parallel bus interface A couple of years ago, I mailed out about 13 copies of all the data I have on hand about the parallel bus, including Atari's draft spec for an expansion chassis (which they never put on the market), the bus connector pinouts, and a schematic for a do-it-yourself general purpose interface set up to implement a software-programmable rs-232 serial port (i.e. uses a PIA to let you program the comm parameters). The serial port can be made to run at 19.2 kbaud if you care.

This time around, I would prefer not to have the hassle of duplicating and mailing multiple copies, but if someone out there will volunteer to do the duplicating and mailing to all who request copies, I will be glad to send one (1) copy to said willing victim.

3093. Looking for the man with CPU upgrades

Newsgroup: comp.sys.atari.8bit
Date: 1990-03-08 06:13:53 UTC
From: psu@mtuni.ATT.COM
Message-ID: <2860@mtuni.ATT.COM>
Source record: 114997

Someone out there posted an article about him working on a accelerator project for the ATari 8-bit last month. I send mail to him, but the E-mail system didn't like his address. Could this person indentify himself? Could he leave me some method of contacting him by method other than infonet? (such as by phone). I am very interested in his project.

Out of curiousity, does anyone know if I could put a Apple Zip chip into an Atari?

> [good list of 6502 crocks deleted]
Thanks but I am not doing any of those things. Nonetheless, they are
good to know, especially the indirect jump problem.

My personal thanks for the responses I have received so far. I don't
know the exact problem yet, but I may have a work-around; the problems
went away when I set the listing option to expand macros (so I could
see if that was the problem), and it went away. Now I made some other
"insignificant" changes as well, unfortunately. If the error happens
again, I will be more careful to keep the bad binary and this time
diff it against the closest working one I can get. If I end up finding
out any more I will post.

I don't have an XEP80, but I know that Bobterm supports it (V. 1.1)

3096. 80-col. telecomm.

Newsgroup: comp.sys.atari.8bit
Date: 1990-03-08 18:21:23 UTC
From: pm16579@uxa.cso.uiuc.edu
Message-ID: <49700015@uxa.cso.uiuc.edu>
Source record: 115000

Does anyone have any input they can give me on software-driven 80-col.
telecommunications programs?
The only ones that I know of are VT100 (or I think it's called
VT10sqr) which does'nt have file transfer, and Omnicom, which I am
using now (hopefully I will get the docs soon; it's a great program
and the text looks great on a color monitor).
I really like Bobterm, but I haven't fiddled with it since getting
Omnicom. Very slick thing; I find it to be aesthetically pleasing.
Has Robert Puff come out with an 80-column module? I have the XEP80
driver, but I can't afford to get an XEP80 and another monitor.
Maybe if I get too bored over spring break I'll try to implement
80 columns on it, but I doubt that I would be that persistent/
ingenious/bored/clever/patient.

Thanks in advance.

3097. MYDOS Internals

Newsgroup: comp.sys.atari.8bit
Date: 1990-03-08 19:50:57 UTC
From: slackey@bbn.com
Message-ID: <53213@bbn.COM>
Source record: 115001

I am getting close to the point of substituting my stuff
for the DUP that would normally go with MYDOS. I have looked
through the listings, but have not yet found the asnwers to these.

1. There is marked a section of MDUP that is remains resident. It
is the portion that handles MEM.SYS and the reloading of DUP.SYS.

How is it loaded? At the time DOS.SYS is loaded? Or is it somehow
appended to DOS.SYS by BUILD?

I don't need it in my system, and would like to get the memory back.

2. I need the XEP driver, and it looks like the best thing for me
is to put it into MDOS. I don't need it relocatable, and there is
other functionality I can pull out as well. Any suggestions?

Source record: 114907

Do any of the term programs available for the 8-bit allow you to set them in such a way that they will answer an incoming call and then automatically download (xmodem, ymodem, kermit, whatever) a file? I've used this technique once or twice on the Mac at work (using "MicroPhone") when someone says there gonna call "shortly" to upload a file to me and I want to go to lunch...you just set the program to auto-answer and when the call comes in and the person at the other end sends x-modem, this term program will automatically accept the file and save it as "Temp" (or whatever). Come back from lunch and the file is ready and waiting. Any way to do this same thing on the Atari?

3102. Re: Diskcomm problems on 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1990-04-19 15:36:44 UTC
From: den@hpfinote.HP.COM
Message-ID: <19810009@hpfinote.HP.COM>
Source record: 114905

My disk drive is an Indus GT using single-sided disks. I am guessing that the problem is with my RAMdisk hardware on my 800XL. Diskcomm is probably writing to the bank select port at $D301 and switching the RAM bank when it really shouldn't. When I load my modified Translator, I disable the RAMdisk and force which banks are used, so the software can't change it.

Many thanks to all who have responded to this. I still can't explain why this method works, but as long as it does, no problem.

3103. Mydos 4.51 Diskcomm file?

Newsgroup: comp.sys.atari.8bit
Date: 1990-04-19 15:42:24 UTC
From: den@hpfinote.HP.COM
Message-ID: <19810010@hpfinote.HP.COM>
Source record: 114906

Does anyone have a Diskcomm file for Mydos 4.51? Now that I have Mydos 4.50 running I would like to upgrade. I haven't been able to get the A65 assembler running and I would like to avoid downloading the Mydos 4.51 source and edit it to use the Atari assembler. This would be a real pain as the Atari assembler requires line numbers and doesn't understand the HIGH[] and LOW[] functions.

Email about this to Charles Marslett at killer.dallas.tx.us bounces back. This address worked last November, so something has changed. That's why I'm posting this request here.

Please email to reduce net loading, unless you think this is useful to others,

Don Novy

> Is there a way to make the atari auto-download?

I think this MIGHT be possible with the term programme BACKTALK, from the antic catalog. I'm not sure though..

I have the program, and if you like using EXTENSIVE macros, and don't mind programming them, it is the program for you! You can have the program wait until 2am in the morning (set a pause for 5 hours before the macro executes), call a BBS, download a file, read new messages, upload a file, leave a good-night note to the sysop, and logoff. However, you must have EXTENSIVE know-ledge of the system you are calling, so that the macro will execute properly.

I hope I helped ya a LITTLE!

3109. IBM -> Atari

Newsgroup: comp.sys.atari.8bit
Date: 1990-04-20 20:04:54 UTC
From: rrwood@lotus.uwaterloo.ca
Message-ID: <1990Apr20.200454.26344@watdragon.waterloo.edu>
Source record: 114910

By the way, that program I posted (the one to read/write MYDOS disks on an IBM/compatible) is available on terminator in the msdos/util/disk subdirectory. I was told to ftp "emptys.cc.umich.edu" but that just seems to connect to terminator. Would someone post the results of trying this program? Don't forget to format the disk on an IBM to start with; the IBM's drive relies on the alignment notch (that little punched-out hole), whereas the Atari drives ignore its existence.

-Roy Wood.

3110. Re: R/W Atari disks with your IBM PC!!!!!!!!!!!!!

I have used the program being discussed here, and it has worked fine.
If you're just getting it in a loop, I have to ask how you are invoking
it. It is meant to be invoked with certain parameters which I forget
just now, in MS-DOS syntax (it runs on the PC, not the Atari), but
if invoked just by name without parameters, the copy *I* have will
list a HELP screen of impressive proportions. Does yours do that?
Try a ? mark as a single parameter and see if that helps.

I would be glad to post MYDOS ver. 4.50, if many people want it, or email the uuencoded discommed file to a coupla people. (It must be great to hear people talk about shareware programs you've written! The check is in the mail, guys....)
I have a question: I downloaded the source code to MYDOS 4.51 and tried to assemble it, but I kept getting 139-DEVICE NAK errors. I can't understand what went wrong, other than the source code was written on a machine that had a peripheral I don't have, or the initialization routine before ver.4.51 pops up is awry. I had recently upgraded my 800XL using ICD's RAMBO 256K upgrade, but the error occured both before and after the upgrade (don't know if that makes a difference....) Can anyone using 4.51 post or mail a copy? And does anyone who assembled the source code from TERMINATOR know what I did wrong?

I followed the assembly instructions exactly.

3116. Atari 400

Newsgroup: comp.sys.atari.8bit
Date: 1990-04-24 12:13:48 UTC
From: bush@acsu.buffalo.edu
Message-ID: <22822@eerie.acsu.Buffalo.EDU>
Source record: 114922

Hello all...
I was wondering if someone (or several someones) out there could give me some information. I have an old Atari 400 which I picked up with a couple game cartridges at a flea market, in 1985. I've since moved on to bigger and better things, but it pains me to leave this thing unused in my attic. First, can someone tell me if this can serve any purpose other than playing Wizard of Wor (which I got with it). Please, no boat anchor jokes, etc. Is there still any source of game cartridges for such a beast, mail order, user groups, etc. Also along those lines, if I want to fiddle around programming the thing, I'll need either or both of two things, the Basic cartridge, and/or a disk drive or tape drive. Are such hardware devices still available somewhere, i.e. above for cartridges. Lastly, could someone summarize for me the technical details of this machine, i.e. CPU, memory, also identification of the connections in the cartridge port, as well as any other external ports, etc. I would like to know if anyone has or knows where to get literature on this little machine, and a source for products. I realize it is practically an antique, so any and all information is appreciated. Thanks in advance.

Chris Bush

3117. Re: Mydos 4.51 Diskcomm file?

Newsgroup: comp.sys.atari.8bit
Date: 1990-04-24 15:01:27 UTC
From: den@hpfinote.HP.COM
Message-ID: <19810011@hpfinote.HP.COM>
Source record: 114920

Whew! After a lot of frustration, I have Mydos 4.51 running. The A65 assembler didn't run probably because the uudecoded file I downloaded to my 800XL got corrupted. When I downloaded the executable, all worked great.

When I edited the files to use the Atari assembler, I must have messed up something, because the original Mydos 4.51 source files assembled great with A65. A65 is also much faster than Atari's assembler; many thanks and a job well done to Charles Marslett and Bob Puff.A

Thanks also to those who responded by email and pointed out the incompatibility of my original Claus Buchholz 800XL ram disk with Diskcomm and probably Mydos, too. I'll look into the new modifications which could be tricky as I still want the 4 joystick capability.

Again, thanks to all who shared their ideas,

Don Novy

3118. Upgrades finally...

Newsgroup: comp.sys.atari.8bit
Date: 1990-04-25 00:32:58 UTC
From: Ordania-DM@cup.portal.com
Message-ID: <29268@cup.portal.com>
Source record: 114921

Ok, this is the first of a series of posts about upgrades for the Atari 8-bit computers. Grab these upgrade texts NOW, you never know when you'll wish you had...
The first text describes how to add a second (third & fourth) 6520 to your Atari 800XL or 130XE.
Here it is:

PIA Upgrade by Charles Hughes
Copyright 1990

So, you're a hacker are you? Well, then this upgrade is for you. If you aren't a hacker, well, have a try at it anyway.
A special NOTE - this upgrade can be done on ANY atari 8-bit computer, but these instructions only cover the 800 XL and 130XE machines.

Performing this upgrade gives you a second PIA chip in your computer. You are probably wondering just what a second PIA chip can do for you, the answer is - anything you could do with the first, only better.
Some possibe uses are listed at the end of this text file.

Here are some standard precautions:
1) Opening your machine voids any warranty you may have.
2) CMOS chips hate static...ground yourself before working on your computer.
3) The author of this text is not responsible for what you do to your computer. If you aren't proficent at soldering, don't know a socket from an IC, or feel you are a total incompetent when it comes to the inside of your computer, then DON'T TOUCH!

Parts needed:

*1 65C21 (PIA chip)
1 74F139 (Dual 2:4 decoder)
1 74F138 (3:8 decoder)
1 16 pin IC socket
1 small perfboard about 2"x3"
Wire (lots of it, Radio Shack #278-372 - 24 gauge, 4 conductor telephone wire works great)
Phillips screwdriver
Pair of needlenose pliers
Rosin Core solder
Soldering Iron (25 to 30 watt)
Desoldering Iron (or Solder Sucker, but do not use solder braid)
IC Puller, etc
Several small cups for holding screws

Most XE computers will also need:
1 16 pin IC socket
1 40 pin IC socket

* There are several versions of the PIA chip any of the following will work: 6520, 65C20, 65C21, 6820, 6821, and of course C014795 (Atari's chip #).

What to do:

1) Completely disconnect all cords, cartridges, and other items not permanently attached to your computer. Lay them to the side so that they can be reattached when you are finished.

2) Find a place in your house to do the actual work - it should be well lighted, have a power outlet nearby, and safe from accidents (like little kids interested in the pretty parts of your computer :). Sit down, put your computer on the table (bench, workspace, whatever) and continue with #3.

3) Turn your computer over. Remove the phillips head screws that are holding the bottom cover on. Place the screws in a cup, don't lose the screws, they are a pain to try to replace.

4) Ok, here is the first fun part -
A) Turn your computer back over and gently lift the top off. Place the top somewhere safe. NOTE: on the XL series the keyboard may be attached to the top, just pull the keyboard cable free of the motherboard as indicated in B.
B) Take the keyboard and slowly lift up, you will find that it is attached by a ribbon cable - pull this cable free of the main board and then place the keyboard with the top.
C) Locate the screws spaced around the motherboard that hold it onto the bottom. Remove these screws and put them in a second cup. NOTE: Some machines aren't attached with screws, you can just lift the motherboard free of the bottom case.
D) Pull the motherboard free of the bottom case. This is a little difficult, but if you do it slowly and carefully you won't hurt anything. Put the bottom cover to one side.
E) Remove the metal shields.
I. On some models the metal shields are attached by screws, remove these to remove the shields.
II. On other models the shields are held on by little metal tabs. Using the pliers, twist the little metal tabs so that you release the top metal shield.
F) Remove the top and bottom metal shields and place them to the side.
G) Place the motherboard, chip side up, in front of you. Go onto step 5.

5) Okay, you now have the motherboard sitting in front of you.
A) Position the motherboard so that the joystick ports are to your right.

B) Look at the 40 pin IC's and locate the one that has "6520" and/or "C014795" printed on it somewhere. This is the PIA chip already installed in your computer. In the 130XE this is near the joystick ports, in the 800XL this is the right most chip nearest you.
C) Look around the board for a small 16 pin IC with "74LS138" printed on it. This IC enables the PIA when it is accessed by the CPU. On the 130XE this IC is just below the PIA, on the 800XL this chip is the second IC down from the cartridge port.
D) Remember where these are...we'll be coming back to them. Now continue on with #6.

6) Okay, now an easy/hard part depending on the machine you have.
A) Remove the PIA from the motherboard. If the PIA is socketed this is easy - just use a small screwdriver to pry up each end a little at a time until you manage to free the entire chip. If the PIA is soldered in, pull out the desoldering iron and desolder it. Solder in a 40 pin socket i needed.
B) Remove the 74LS138 chip same as you removed the PIA. Solder in a 16 pin socket if necessary. Place the 74F138 in the socket. Put the 74LS138 in a safe place, you might be able to use it for some project in the future but you won't need it for this one.

7) Now we add the new PIA.
A) Take the new PIA (called PIA1 from now on) and bend pins 16 and 23 up so that they stick straight out from the sides of the chip. NOTE: If you have a memory upgrade that uses other pins on the old PIA you can bend up the same ones on the PIA1 and reattach the wires there.
B) Now take the PIA you just removed (called PIA2 from now on) and bend pins 2-19, 23, and 37-40 straight out the same way.
C) Place PIA2 on top of PIA1 so that all the pins not bent up on PIA2 touch the same pins on PIA1.
D) Solder pins 1, 20-22, and 24-36 of PIA2 to the same pins on PIA1.
E) Put this set of chips to the side for now and continue with 8 below.

8) Now we have to create the minor circuit needed for the upgrade.
A) Take the perf board you have, and put the 16 pin socket on it. The best place for it is in the upper left corner of the board. There is a notch in the black plastic of the chip, this indicates the placement of the IC chip. Holding the socket so that the notch is away from you, pin 1 is the first pin on the left hand side, pin 2 is the one below it, etc all the way to pin 8 the last pin on that side. On the right hand side, opposite pin 8 is pin 9, opposite pin 7 is pin 10, etc all the way to pin 16 which is opposite pin 1.
B) Cut 7 pieces of wire about 8 inches long and strip off about a 1/4 inch of insulation on each end of all the wires.
C) Solder one end of each wire to pins 1-5, 8, and 16.
D) Now take the wire you soldered to pin 8 and solder the other end to pin 8 of the 74F138 you located earlier. If you prefer, you can solder wires that wuld attach to the 74F138 to the back of the motherboard. Just make sure you solder them to the correct pins of the '138 socket.

E) Solder the wire from pin 16 to pin 16 of the 74F138.
F) Solder the wire from pin 1 to pin 12 of the 74F138.
G) Solder the wire from pin 4 to pin 23 of PIA1.
H) Solder the wire from pin 5 to pin 23 of PIA2.
I) Insert the stacked PIAs into the PIA socket.
J) Take the 74F139 chip and place it in the 16 pin socket so that the notch in the chip is pointing in the same direction as the notch in the socket.

10) You now have two wires left unconnected. These two wires need to be connected to address lines A2 and A3. You can connect these wires to A2 & A3 anywhere you like, but the easiest place to solder these wires is to the ANTIC chip. Find the chip labeled "C021697". This is ANTIC.
A) Solder the wire that comes from pin 2 of the 16 pin socket to pin 11 of the ANTIC chip (address line A2).
B) Solder the wire that comes from pin 3 of the 16 pin socket to pin 10 of the ANTIC chip (address line A3).

Another place to get these lines if from the parallel bus.
On the 800XL in the upper left hand corner are a pair of IC chips. The top chip is BASIC, the chip beneath it is the OS ROM. To the right of the OS ROM is a line of solder points. The first point is A2, the second is A3.
If you have a 130XE look at the cartridge port, it should look like this:

```
| | | | | | | | | | | | | | |
ECI | | | | | | | | | | | | | | SIO
. . . . . . . . . . . . . 2 .
.
. 3
. .
```

This is a really rough drawing, the | indicate pins on the cartridge port, the . are solder points, the 2 is the solder point for A2, and the 3 is the solder point for A3. Just melt the solder at these points and stick the appropriate wire into the solder while it is still molten. ECI is the small connector to the right of the cartridge slot, SIO is the 13 pin sio connector to the left of the cartridge slot.
1200XL, 600XL, 65XE, and XEGS owners are on their own, I do not have any of these machines available to find suitable solder points on. I believe that the 600XL is identical to the 800XL as far as the parallel bus is concerned so you may be able to find the solder points in the same place. Remember however, that the soldering to the ANTIC chip will work regardless of the machine.

11) You need to put the perfboard in a safe place. If it is just hanging in midair let it keep hanging for now, but don't let any of the pins touch anything else.

12) Check all your connections and make sure you have followed all the steps above.

13) You have now finished all the necessary wiring. Now you have to test the finished product. Don't bother putting it all back together yet, just grab the bottom case of the computer and lay the motherboard in it. Plug in a basic cartridge (if you don't have any memory upgrades you don't need to use a basic cartridge). Connect the video connector. Connect the power cord. Turn on the computer. If you don't get a "READY" prompt and a blue screen, turn off the computer immediately and recheck all your work.

14) If you do get a "READY" prompt & blue screen, type in the following program:

```
10 P1=54016:P2=54020
20 ?PEEK(P1),PEEK(P1+1),PEEK(P2),PEEK(P2+1)
30 GOTO 20
```

15) Run the program. The first 2 numbers shouldn't change, the next two numbers may change and WON'T be exactly the same as the first two. If you stick a joystick in port 0 or 1 you can vary the second number. If the numbers are all the same, or all of them keep changing, turn off the computer, remove the power cord and recheck all your connections.

16) That's all there is to it, now reassemble your computer in reverse order of the way you disassembled it. :) Of course, you'll need to do something with the perfboard. Cover the pins of the 16 pin socket with an insulator (electricians tape or pieces of antistatic foam work well for this), turn the board over slowly and push it face down in an open space on the motherboard. You should then be able to put the metal shield back on. If you can't, don't worry about it unless you get TV interference. If you get TV interference, move the computer farther from the TV.

Okay, now to wrap this text file up. You now have a second PIA chip located at addresses 54020-54023 ($D304-$D307). Here is the pinout of a 6520 (6521, 6821, 65C21, 6821B, etc):

Pin Function
1 GND This connects to the system ground.
2-9 PA0-PA7 These are the port A pins.
10-17 PB0-PB7 These are the port B pins.
18 CB1 This is control line 1 of port B.
19 CB2 This is control line 2 of port B.
20 POWER This connects to the system power (+5 volts).

_
21 R/W This is the system read/write line. The line above the write indicates that writes occur when the line goes low (0 volts).
22 CS0 Chip select 0.
23 CS2 Chip select 2. This is an inverted signal - the chip is selected whenever CS2 goes low.
24 CS1 Chip select 1.
25 E This is the system clock line.
26-33 D0-D7 These are the system data lines D0-D7.
34 RESET When this line is pulled low the chip performs a reset. This reset forces all pins to input.
35-36 A0-A1 These are address lines A0 & A1 from the system bus.

37 IRQA Port A IRQ.
38 IRQB Port B IRQ.
39 CA2 This is control line 2 of port A.
40 CA1 This is control line 1 of port B.

And here is a short memory map of the new PIA.

PIA2: 6520 CHIP

54020 $D304 PORT2A
(R/W) Controls the port A pins on the second PIA. Writes to direction control if bit 2 of PACTL2 is zero.
This port should be used for memory upgrades. To access any bank of extended memory using this port the extra lines needed for the memory should be attached in order starting at pin 2. A routine to access the extended memory is given below:

```
BASIC:
X =INT(BANK_NUMBER/4)
P2=BANK_NUMBER-X*4
Q =PEEK(54017)
Y =Q-INT(Q/4)*4
Z =INT(Q/32)*32
P1=Z+32+X*4+Y
POKE 54020,P2:POKE 54017,P1

ASSEMBLY LANGUAGE:
LDA BANK ; Load the bank number
TAX ; Save it for future use
LSR ; Divide by 4
LSR
TAY ; Save the upper bank control number
TXA ; Reload the original bank number
AND #%00000011 ; Mask out the rest of the bank number
ASL ; Multiply by 4 to get into position
ASL
STA TEMP ; Save again
LDA PORTB1 ; ($D301, 54017) Load the normal bank control
AND #%11100011 ; Zero out the old bank control bits
CLC
ADC TEMP ; Add the new bank control bits in.
STA PORTB1 ; Select extended RAM and lowest 2 bits of the bank
number.
TYA ; Get the upper 6 bits
STA PORTA2 ; Store the upper 6 bits of the bank number.

; 8 bits worth of banks is 256 banks or 4 Megabytes.
```

54021 $D305 PORT2B
(R/W) Controls the port B pins on the second PIA. Writes to direction control if bit 2 of PACTL2 is zero.
This port should be used as a parallel port. The most likely use

would be a centronics printer port.

54022 $D306 PACTL2
(R/W) This is the PORT2A controller. Check out "MAPPING THE ATARI" or a datasheet on the 6520 PIA for more information on this.

54023 $D307 PBCTL2
(R/W) This is the PORT2A controller. Check out "MAPPING THE ATARI" or a datasheet on the 6520 PIA for more information on this.

Here are some questions that will probably be asked about this upgrade and, of course, the answers to them.

Q: Why use 2 address lines to select only 2 PIA's?

A: Several reasons - the specific chip used (74F139) is a DUAL 2:4 decoder. This means using 2 address lines it can select 4 PIA's. If you decide you want another PIA just solder it on top of the others, run a wire from pin 4 of the 16 pin socket to the pin 23 of the PIA and you have a third PIA. A fourth PIA works the same except the wire comes from pin 5 of the 16 pin socket. Also, most memory upgrades use a 74LS138 or 74LS139. Since we only use 1 of the 2 2:4 decoders in the 74F139, and all the memory upgrades (except my monster 4MEG one :) use the equivalent of 1 2:4 decoder, we can remove the other chip and rewire the memory upgrade slightly so that it uses our 74F139.

Q: Why use a perfboard, why not just put the 74F139 on the motherboard someplace?

A: Easy question. The reason for this is so that you can add other circuits to the perfboard and not lose access to any of the chips on the motherboard. The perfboard has enough space to hold the IC's needed for any upgrade and that is what I use it for in my computer.

Q: Why did you replace the 74LS138 on the motherboard with a 74F138?

A: Because the 74LS138 was too SLOW. My first attempt at this upgrade frustrated me so much that I quit for a few weeks in order to avoid attacking my computer with a sledgehammer.

More questions will be added as I receive them (or think them up myself :).

Future projects for this upgrade:

1. Restore the 2 missing joystick ports.
This isn't difficult, but currently no software except that which you write yourself would work. As soon as I get the time I will explain exactly how to add 2 joystick ports that are almost identical to the ones that the 400/800 had.

2. Add additional internal ROMS - multiple OS's, BASIC & ASSEMBLER, etc.
The XEGS machine has BASIC and STAR RAIDERS built into it. There are several ways this could have been done, the most likely way is through the

use of bit 6 of port B of PIA1. Port B controls bank selection and bit 6 is the only bit that was unused in the 130XE so it is the most likely candidate for controlling whether BASIC or STAR RAIDERS is accessed. There is no reason you can't have BASIC and STAR RAIDERS built in too, nor is there any reason you couldn't have any cartridge built in.

3. Really get sick and control up to 8 megs of internal memory.
This is my main reason for adding the second PIA. I bought 144 256K dram chips real cheap, so I wanted to make a HUGE upgrade. I haven't done it yet, but I probably will add 2 MEGs right onboard my computer. (There is a use for this, see below.)

4. Run several "virtual" machines.
Tom Hunt of MTOS fame created a wonderful program called SNAPSHOT. What it does is take a 'snapshot' of what your computer looks like and stores it in extended ram - i.e. 16K rambanks found on upgraded machines and 130XE's. Each snapshot takes up 64K (4 banks). You can then switch snapshots by pressing a few keys. You could have Textpro running, activate the snapshot program, and then be in Bobterm. The snapshot program creates a virtual machine that it swaps in and out of main ram when snapshot is activated. With his help I plan on creating a special upgrade that does in hardware what he is doing in software. So, when snapshot is called, instead of the program actually copying the main ram to the extend ram it will just swap ram in 64K chunks. This will speed up the snapshot process and make it considerably more useful.

5. Add a centronics parallel printer interface.
This is easier than it might sound at first. The PIA is made for exactly this type of work. A few wires, a centronics connector, and some software and you have a standard printer port.

6. Add an RS232 port.
This is an extensive project, not hard but not anywhere near as simple as just adding the PIA. However, it would cost a lot less than an 850 interface, and would work better than it too.

7. Get rid of all the nasty switches you have stuck in various places on your computer! (Except for the cold start switch of course. :)
Certain upgrades require switches in order to enable/disable banks of ram so that the switchable BASIC, ANTIC, SELFTEST, and OS can be used. This is silly, just rewire the upgrade so that it uses port A of PIA2 and you have all the extra memory you need accessible all the time. There is a catch of course, there is no software that recognizes this second PIA, YET! I'll have an RD.COM file for SPARTA ready soon, and a fix file for MYDOS when I get the chance. SpartaDos X is a whole other ball of wax...I can modify the ramdisk driver I think, but since the SDX cart looks for the total memory available when it first boots I don't think I can write a patch for it. ICD has promised to do so if this upgrade is popular enough. So let's make it popular, ok? :)

Those are just a few that I could think of off the top of my head, I am sure others will occur to me and, hopefully, to you.

I downloaded a working version of this program from a local bbs
with the "C" and Assembler source for the PC. But it seems
to need a real double density drive on the atari to work.

The bbs I called is C.C.C. (513)752-1055 (1200-2400)
(513)752-8248 (9600)

by the way, this is a subcription bbs, but I think you can
download something if you upload something. Look in conference #1
the big CD ROM. This bbs has 8 Nodes.

By the way, I also found a pascal version of the same type of
program on this BBS.

Hope this helps

3121. Digitalk on Atari 800 family

Newsgroup: comp.sys.atari.8bit
Date: 1990-04-26 15:03:16 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1673@lzsc.ATT.COM>
Source record: 114925
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I've taken the liberty to cross-post to atari.st, as that is where
old time 800 users may be.

I had a speach unit that plugged into the Atari BUS called, I think,
Digi-talk. It expanded spelled words into speech. It also had a
phoneme list, sounds that particular codes make. I gave all this away
many years ago.

I recently bought a similar unit (probably the same chip) for a PC.
No documentation.

Is there someone out there that has this beast still that would consider
sending me a copy of the manual dealing with the sound and phonemes?

Thanks

When I first bought Mr. Do, it was when 8-bit games were plentifully available. I played it a little, then shelved it when the next neat game came along. Recently however, I have found myself really addicted to this sucker. Unfortunately, I no longer have the instructions. It doesn't take a mental giant to figure out the game, so I'm not too concerned. The only question I have (and hopefully someone out there can answer) is "How do you create a diamond?" I've done it a number of times by accident but I can't remember what you specifically have to do to get one. Thanks for your help.

The diamonds were random. There was no special pattern to prompt their
appearance.

3124. PRINTER HELP NEEDED: DAISY DOT II/OTHERS

Newsgroup: comp.sys.atari.8bit
Date: 1990-04-28 21:18:02 UTC
From: Metalist@cup.portal.com
Message-ID: <29405@cup.portal.com>
Source record: 114928

Hello I need any valuable printer programs available:

- Koala pad PIC printer dumpers
- GR9 pic dumpers
- graphics programs
- word processors
- mail merging programs
- label making programs
- in short, everything that has to do with printers and is in the Public Domain or is shareware!!

I am hungry for stuff for my printer (IT'S AN EPSON LX-86), and want to use it to the highest ability.

so far I have Textpro 4.5 and Speedscript. Ok programs..

I also got DDOT2.UUE from listserv@tcsvm.bitnet, and it works ok I guess, but when printing, the words get cut
in half at the right margin, though
I don't WANT them to get cut sort!

How can I get respectable printouts?? How can I take a file formatted for TEXTPRO with its awesome print controlling commands to come out as nice on daisy dot II?? Is it possible to
implement the fonts of DDii in textpro?

Oh yes.. how do I print fonts to my epson so it will print in fonts instead of the standard character set, besides using the cheap daisy dot II printer program????

Thanks for any help.. please, don't be shy; help me with ANYTHING...

OH YES! I want a VERY GOOD disk librarian. I have seen one which needs DOS 3, I don't want that one; another which is cheap, it has a bunch of options on the left, with an asterisk (*) showing what function you're on; you use the u and down arrows to move to a different function. I don7t want that one either.

I want a program that will allow me to catalog my disks by #, then by side (1a, 1b, for example), and enable me to show the sector count, filetype, etc. a whole mess of info, in the printout. Also if it could be printed out in two columns, this would be great!

Thanks for any assistance..

3125. Bob Brodie in Rochester (mini-review), and TT talk

Newsgroup: comp.sys.atari.8bit
Date: 1990-04-30 01:41:58 UTC
From: sale5312@fredonia.UUCP
Message-ID: <1837@fredonia.UUCP>
Source record: 114929
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Yesterday (4/28) I was able to attend the talk Bob Brodie gave at the Rochester Institute of Technology. I went with 8 members of my local ST user group, The Buffalo Region Atari Group (BRAG-ST). In total, I would estimate the total number of people who attended the talk would be about 80 at the Webb Auditorium at RIT.

Mr. Brodie brought along with him a 4 MB 4160(?)STe, a 4MB Stacy, a Lynx, a Megafile 60 HD, and a 44 MB removable HD system. He spoke about each unit, which lasted about 40 minutes, then took Q&A for about 1-1/2 to 2 hours(!). Maybe longer, I lost count...:^) Mr. Brodie mentioned that all the products he was showing were *not* vaporware, and were shipping..."somewhere"... For your Lynx fans, he mentioned that he hoped that there would be over 20 games for the Lynx by X-mas. (The STe is shipping, but I believe Atari is having doubts about shipping the 4 MB version.)

Mr. Brodie showed the Lynx commercial that was test-run in NYC and other places. I see it quite often living near Canada on the CBC.

Mr. Brodie also mentioned that Atari feels that the 130XE is no longer a "power without the price" computer, and will phase-out the 8-bits. I am sad to hear this (I started out with a 400 many moons ago), but at the same time it is understandable. A 130XE + disk drive is just about the price of a 520STFM. He said that the last 130XE has been produced (a 50,000 run?) but they'll be used in house for the exchange policy. Argue if you want, but the 8-bit era is over in the 90's. :^(

After the Q&A finished, there was a raffle of the 80-col card and the word processor built for it (8 bit), 5 or 6 TOS 1.4 upgrades (both 6 and 2 chip sets) and also the Megafile 60 HD he used for the demo. (Although I didn't win anything, other members in my BRAG group won the Megafile 60 and three TOS 1.4's...hey- gotta BRAG, right? :^) Oh yes, tickets were only $1 ea. for the raffle, and I guess the show was free. Also the *new* Lynx cart, Gauntlet, was a prize in the raffle.

The show concluded with an auction of Atari products of a store that phased-out their Atari line. Several titles went under $4. VIP Professional, still in the cellophane wrapping, went for $10. I picked up Infocom's "Deadline" (ST), a Chinese cooking database (ST, for my girlfriend; I'm a vegetarian...:^), a Logo book (was bundled with the cooking program), and the 130XE and DOS 2.5 manuals (XE) all for under $6 total. After the auction the group left the Auditorium and went to a pizza party with Mr. Brodie, with tickets costing $4. BRAG did not stick around for the pizza.

After seeing the show I left disappointed. Not at all with Mr. Brodie;
I was very impressed with him. I've been to several shows along these lines
(Atari, Apple, NeXT, etc.) and Mr. Brodie is one of the best speakers
(and perhaps more importantly, *listeners*) I've seen. He is a real credit
to the Atari family, and I hope he sticks around for a while (lifetime
contract would be ok...:^) I think Atari can sleep at night knowing that
Mr. Brodie is one of the people contacting us peons who use or want to
Atari computers. If any Atari junkie has the chance to see him talk,
I recommend it.

So why was I disappointed? Maybe because I am sick of the "game machine"
image Atari has. My girlfriend who also attended teases me about how my
ST is a game machine (friendly, but others aren't that nice.) Although
I am very happy with my ST (I couldn't have survived college without
1st Word, Thunder, Uniterm, etc.), I would like a faster unit and Unix.

Faster unit and Unix. Ah ha! The TT! Let me state that if Atari
introduced the TT (Unix, 68030, runs ST software too) for under $3000
a year ago I would have been first line for one (well, maybe not
first, at least until I could have raised the money.) Now I'm not so
sure about getting one ASAP, if at all. The great majority of
questions was about the Lynx, local dealer problems, etc. There
was one or two about the TT, but nothing much was said. Of course,
this is because it is not being manufactured now which is understandable,
but there seemed to be zero interest in the machine. One of the reasons
I went to the show was to find info on it, but all I got was that the
TT passed FCC tests and software was being worked on now. Mr. Brodie did
not give a release date (i.e. "very soon", "September", etc.) which I
think is a good thing. Instead of the "very soon now" or "{1,2,3,4}
Quarter of next year", saying nothing about a release date will not make
him (or Atari) look bad should the machine fail to appear (nah...that wouldn't
happen, would it? :^)

If the TT appears late this year or early 1991, I will not buy one for
at least two years. Why? First, I bought my ST in October of 1985, and I
thought that this would be the machine that would defeat the Mac (or at least
come very close to it.) I didn't think that even Atari could mess it up.
But what happened? Instead of getting the (then) under-$1,000 512K 68000
based machine (i.e. power) into colleges and business applications, it's
sold through Toys R Us. Toys R Us? Think of Toys R Us. What do you
think of? I think of 3-to-5-year-olds running up and down the store. If I
don't want to buy a computer there, would upper-level executives? Or people
in charge of universities? And what about support?

I thought that Atari, having a reputation problem then, would give away
ST's (or at least make a *huge* discount) to universities to follow
Apple's lead. That would at least get them "in the door". And I don't
think many places would turn down a free Atari computer because at
least they would have been able to play games if nothing else. :^) Let's
hope Atari doesn't make the same mistake with the TT.

So, to get back to the meeting: with three user groups represented,
I should be able to assume that there was a deceint sample of Atari users.

And if nobody had enough interest to press about the TT (at least get a few more "no comment at this time"'s from Mr. Brodie, should I, an Atari ST user, be worried? That is one thing I haven't figured out yet.

Who is Atari going to aim the TT at? (Let me assume that the TT will be 68030-based, run some flavor of Unix, and be ST upward-compatable.) Will Atari try to sell the TT to the current ST userbase as an upgrade? I hope not, at least as a major source of sales. Sure, there are some of us who would love getting a much faster ST *and* Unix, but the majority (at least a good number) I'd guess of current ST users don't really want Unix. (This will be debated here since about >90% of you reading this via Usenet are probably using Unix right now, either rn, readnews, etc.) I got to see for the first time a bunch of ST users (ok, just 70), but they didn't seem to know what a Unix is or if you have to feed it and burp it. That's fine, but why should Atari try to sell them a TT? I think they shouldn't. You can have a zillion computers sold, but how many will push Unix to the limit? How many will even use the Unix end of the machine?

Ok, then who should Atari sell the TT to? How about schools? If they could offer a big-fat discount to high schools and colleges for a machine that runs both Unix and the pre-existing ST software line and bundle a bunch of PD and/or commercial ST software that shines on it, I think Atari would advance to the next plateau from "game company" to whatever in many eyes (important ones at that.)

I would love to hear in about a year or so, people from the educational and business world saying "Atari finally made a *real* computer this time!", and us past and present ST owners (and 8-bitters for that matter) would just smile and say welcome to the world of Atari...

Last week I attended a NeXT demo at my school, and I really liked the machine. The problem I have is that at over $10,000, I don't see myself getting one (unless I win the lottery or something, but since I don't play I don't see myself winning...:^) It's a really fine computer that's worth the >$10K, but for the low-to-medium user like me? It's just not practical for what I'd use it for at home (little word processing, and Really-Not-Professional C programs...at least not the commercial type...) I suspect that there are a few others out there who would like to have a Unix computer, but can't afford the current crop. If the TT could fill this void (be under $3000) Atari's got a hit on their hands, *if* they sell it as a Unix computer first, ST compatable second. "Runs Unix and has a library of programs that can already be run on it too!" would be a nice pitch for the TT. I just can't see Atari hoping to sell the TT *only* to the current ST user base.

To conclude (finally...), I hope no one takes the above as Atari-bashing, which has in the past been fashionable in these newsgroups. I've used an Atari computer since 1983, going through a 400,600XL,130XE, and finally a 520ST w/1 MB. I've sold everything except the 600XL (still 16K, no drive) and the ST. I am hoping I will not have to leave the Atari world. I'm really hoping Atari breaks into the "serious" market with the TT. Should they start to

sell the TT to a more serious user market (not through Toys R Us),
I'll be in line to get one. If I can play Kreskin for a moment,
in five years time, I think I'll be working on a newer computer with a
little Fuji symbol on it...:^)

Well since people are talking about and sending schematics of upgrades I was wondering if any one has any schematics for either building a modem (completely variable) or upgrading an existing modem to a higher baud, for instance I have a 300bd MPP1000e modem that I would like to make either 1200 or 2400 and if I couldn't modify it to that, I would like to try and build one that is. If any one has any information on building modems or that has done it, could you please respond....300bd really sucks and I would like to move up

Since we seem to keep going around and around with the issue of the PC-to-Atari-disk-writer utility, I will soon post MY working copy of it, which I will UUencode using YAU.COM on the Atari itself! THAT should work, if nothing else does. You can download it to the Atari, UUDECODE it, then transmit the resulting raw binary file to the PC of your choice by the mechanism of your choice.

And to answer someone else's comment, YES, you DO have to have a "real double density drive" on your ATARI! Enhanced density WON'T cut it. As for the guy who got a single character -- a smiley face-- for output on his version of the program... well, that's just WEIRD. Maybe this program uses "illegal entry points" into the PC BIOS ROMs and you, smiley-face guy, are on a clone that doesn't (it SHOULDN'T, after all) have ROMs identical to the True IBM PC...

RE: Upgrades....

I had to post this to make sure you all understand something...

Upgrading your 8-bit is a losing proposition - you don't save money by doing it yourself. I do it because I like to, but please don't kid yourselves about the costs. The components alone can get expensive (try a MHz 6502 at $45 :), the startup costs are high (soldering iron, desoldering iron, solder, wire, etc), and the most expensive of all is the time. Sometimes a project will work on the first try, usually it won't. When it doesn't you spend hours trying to figure out just what is wrong, convinced that you did everything perfectly. Guess what, even if you do everything perfectly, the project can still not work. Take my PIA upgrade for example, or Chuck Steinmans POKEY upgrade - on some machines his upgrade won't work, mine for example. My upgrade wouldn't work on my machine either. The reason for this was the logic chips. There were too many and they were too slow.
For the guy who wants to upgrade to a 2400 baud modem - toss your 300 and buy a 2400. If you really want to build one, contact Rockwell, they have a few modem chipsets.
In conclusion...if you see it on the market - buy it if you want/need it. It'll work better and cost less in the long run.

Chris Bush asks about the Atari 400, and about sources of documentation and software...

Probably the best way to find out about these sources would be to get a copy of ANTIC magazine (although that resource is rapidly fading away), or call (313) 973-8825 and ask the delightful voice that answers for a free copy of the Atari Interface Magazine..

Both of these publications carry advertisements from companies which sell 8-bit products still... they'd be a good place to start.

Does anyone remember a while back about the mentioning of a book called something to the effect of "65816/65802 Assembly Language Programming"? I would like to know if anyone has the ISBM number so that I can see about getting a copy of it. Also, how good os the T-816 upgrade. I went through my backlog of Info-Atari8 and saw a mention of a few bugs. Have they been fixed? Please tell me as much as you can, I am considering the T-816 if it is good. And if so, where can I get it?

I am hooked on SpartaDOS X, and am looking to expand my machine to even grater capacities.

Anyone interested in some leftover Mount Redoubt ash? Yepper, she is still steaming. Yes, once again we see the light of the sun up here in Alaska.

If anyone out here has completed the German cave Cavelord, I need a hint on how to proceed. I have explored both the first and second caves but can't seem to get any farther. In the second cave I have found a ring and opened the gateway out, but it just takes me back to the first cave, with the inner door the the rest of the cave closed so I can't get back to the king. I can't find any use for the ring. I have tried giving it to the little guy on the bottom of cave 2 but he just takes a piece of the crown. Could someone give me an idea of what I must do next?

Also, please use e-mail when you reply as I do not receive this digest directly. Thanks.

I don't have the book with me, so I can't give you the ISBN number. The
main problem with the Turbo-816 is the limited processor speed. To keep Antic,
Pokey, and the RAM happy, DataQue had to leave the clock at 1.79Mhz. Therefore,
your regular software will see no speedup unless it uses a lot of OS calls.
(They have been 16-bitized for a little extra speed.) I believe there is a
SpreadSheet for the T-816, but that is about the limit of the software
available. There should also be an SRAM/EPROM board available.
As for bugs, well it seems to work ok. It was doing something funky with my
MIO before, but that seems to be fixed. Now it seems to be doing something
funky with my Doubled 1050, but I'm not really sure what is going on there.
I am working on a little project that, if it is ever completed, should help
software availability a lot. We'll see.
Basically, the 65816 is a nice little chip with a lot of potential, but
forcing it on the XL/XE architecture is not working well.

Someone called me a couple of weeks ago asking about Flight Simulator
II for the Atari 8-bit. Please give me another call. I'm
considering selling the system separately now. My number is
916-894-0887.

Ed Krimen
<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<
Since I haven't seen anything from the listserv for quite some time now,
I'll just say what I have to say about Flight Simulator II...
I Love the program. I had it even before I got my 800XL & 1050 drive.
Now I have a 130XE % the new XF551 drive, but for some reason, Flight
Simulator II won't work when I have the XF551 hooked up. I have to set my
2nd drive (the 1050) to be drive #1 in order for the program to run
without any errors. There's no way to isolate the problem when I get the error
because it gives me a different error each time. Luckily I still have my
trusty 'ol 1050 disk drive. :)
By the way... are there any new and interesting 8-bit BBS's out there?
Thanks,
John - A loyal Atari 8-bit user.

FSII wont work with the XF551 because of the copy protection scheme it uses, and the timing holes. Some information was written about this a while back in either Antic or Analog.

Charles Hughes, I was hoping that I could build a modem that was completely variable. I got the idea from Antic magazine which featured the parallel bus. I only have the 3rd instalment of the article. Its in the March 1985 issue. In it they have a schematic of a setup that uses the parallel port and it has a baud rate generator in it. What I was wondering is there a way to convert what they have down, I beleive its for a serual I/O board, to a modem that can go to the same baud rates that they have down for it....50 to 19200 bd. Is this possible?

Being in flight school, I was more than distressed to find that Flight Sim II wont work with the XF551 because of the 551's industry standard 300 RPM drive speed.

There's no hope other than keeping your 1050. I called Sublogic on the rumor that there was an upgrade disk and they quite clearly told me to get stuffed. Thanks guys.

I've got a 386 too, and had fun with Flight Sim 4.0, but now that I'm running Unix I need flight sim back on the 8-bit and - sigh - no dice.

Anyone out there good with 6502 game to wander through the disk and pull the protection scheme?

John-
I think that you are stuck using your 1050. Do you think that
the xf551 is 'worth it'. I have an old 1050 that makes funny clicking
noises but other that that seems to work fine. I was thinking of
getting another drive, but unless the xf551 is much better I think I
will hold off on getting one. Here is a list of atari bbs. I have not
called all of them up, but most of them are fairly interesting.
(201) 727-2537 Hell Hole
(201) 805-3967 Blank Page
(314) 647-3290 Gateway
(314) 291-0205 sylph
(312) 843-7717 wishing chair
(215) 624-6347 final frontier
(407) 290-0404 atari domain club
(408) 745-5308 Atari corp. xBBS
also,you can FTP to terminator.cc.umich.edu to get some atari
programs, mostly telecommunications.

If I had an XF551 and Flight Simulator (I have neither) I would try one
of the following:
1. Permanently slow down the drive from 300 rpm to 288 rpm. This should
be close enough that things don't break too badly. Or, if that does
not work ...
2. Install a switch to change drive speed on the fly.

Or, if somebody wants to donate an XF551 and Flight Simulator, I would love
to work on breaking the copy protection scheme!
Given the price of used 1050s and 810s I fear nobody will take me up on that
offer.

FS II uses a particularly nasty copy-protection scheme. Normally each disk
track has sectors numbered 1-18. On the FS II disk, there are sectors 1-16,
and two sectors numbered 17. When you go to read that sector, it depends
on the timing (based on what sector you read last, and how long ago) which
of the two copies of sector 17 you get.
Some games do such things on one track, just to check the copy protection.
But FS II does so on every track, and they might even have valid stuff
in both sectors, picking what they get by what sector they read before.

This scheme is fragile, as it will fail, for instance, if the disk drive
retries the read because of an error. And the fact that a change from
288 to 300 rpm broke it shows how little margin for error they left.

I guess all we can do at this point is to be sure to remember this
the next time we are tempted to buy a product from SubLogic.

3143. ATARI 800 AND 1050 DRIVE FOR SALE

Newsgroup: comp.sys.atari.8bit
Date: 1990-05-05 05:57:43 UTC
From: v157rsc7@ubvmsd.cc.buffalo.edu

IMHO no. I have the issues and I do know what you are talking about, but
you are getting confused between what a serial I/O board does and what a modem
does. A modem converts a serial stream of data into tones that can be
transmitted via telephone. A serial I/O board merely converts bytes into
on/off transitions of a serial line - to a telephone this would be roughly
equivalent to lifting the phone up and putting it back down rapidly. You
can use the serial I/O board as an RS232 interface and then add a nice modem.

3146. 800 xl has died (nearly)

Newsgroup: comp.sys.atari.8bit
Date: 1990-05-06 12:40:09 UTC
From: i14@nikhefh.nikhef.nl
Message-ID: <842@nikhefh.nikhef.nl>
Source record: 114950

Hello netters,

I used to be a atari freak for over 4 years. The 800 xl I own, I
bought almost 9 years ago (I think), it then took all of my time
and I think I know quit a lot what can and what can't be done with the
machine (in a software-matic way however, I never did any soldering).
After the 5 years that followed, I had a somewhat busier life (social life,
,university ...)but managed to keep "hacking away" on PC's off all kinds.
Occasionally I used the 800XL for playing games or quick algoritmic tests.
Not long ago I moved to a new house in amsterdam , where I could find
place for the 800Xl and I thought it would be fun to start playing with
it again in the afternoon hours.
Ok, after this introduction (to set moods ...) I'll come to the
point. History of events:
1) starting about 1 year ago , problems with booting
(spark noises and so on , sometimes they were there, then for
longer periods booting was ok)
2) Later there could also be problems while booting went ok, then the
screen would disappear during work for short moments,
accompanied with dry clicks.
3) Booting became harder and harder (is it in the air or not today), and
I clearly had the idea that it needed to 'warm up'.
4) Two weeks ago, I couldn't let it boot anymore
Although I can see a quick glance of READY sometimes.
Dos can be loaded sometimes (after pressing break most often) and
I'm sure the diskdrive and connections to the outside world are ok.
My problem is that there are no people in my neighbourhood that own
a 800 XL and I have the idea that there are very few left in Holland.
So cause I'm very fond of this 'little' one , what could be the problem,
before I break my habit an go soldering away?
Hardware :
Atari 800 XL 64K, Rev B
1050 Diskdrive+Casette recorder+Plotter
DOS 2.0,2.5,3.0

Thanks in advance.

3151. Suggestions for possible upgrades.....

Newsgroup: comp.sys.atari.8bit
Date: 1990-05-09 23:03:13 UTC
From: AXCSH@ALASKA.BITNET
Message-ID: <9005110733.AA03261@ucbvax.Berkeley.EDU>
Source record: 114954

I am not all that much into creating hardware modifications, but I have come up with a few possible suggestions for the 8bit computer. I would like to see maybe the 2817a-25 or 2865a EEPROM (+5vdc r/w) chips used to take the place of the many switches that are probably appearing on many ATARI users computers.

I also saw a "noslot" clock in the most recent JAMECO catalog, that is suppose to be able to be put underneath the OS chip. Has anyone looked into this? I also would like to know if there is any other way to install a decent clock without going to the cartridge version of the ICD R-Time8.

If someone would like more ideas for upgrade possibilities, just let me know and I will dream them up.

3152. Problems with my SDX Cart.

Newsgroup: comp.sys.atari.8bit
Date: 1990-05-09 23:12:54 UTC
From: AXCSH@ALASKA.BITNET
Message-ID: <9005110734.AA03324@ucbvax.Berkeley.EDU>
Source record: 114855

I was wondering if anyone has been comming across a problem with stacking cartridges on top of the SDX cart. I was trying to use the ASED Cartridge to do some programming, and wanted to use SDX 1.19 along with it. Upon starting the computer up as per usual, I had some odd things occur:

1) The "keyclick" began to sound (without any keys being depressed)

2) The scrren began to flicker.

Both of these have never occurred when I used the SDX cart with other software before. I took the SDX cart alone and tried it out, and it was fine. I then tried the ASED cart alone, and it was fine, but together, I kept gettign the same thing.

Any suggestions? If not can anyone please relay this to IDC via their BB that they maintain? I do not want to have to make a costly long-distance call just for this. Any help would be appreciated.

By the way, I have used ASED & SDX together before with no problems.

I know there are some software packages that don't work properly if the
keyboard buffer is enabled (KEY ON). If you have the keyboard buffer
enabled, I would suggest turning it off. This has been documented in
reviews of both SpartaDOS and SDX in issues of both Antic and Analog.
(Antic and Analog? What are those? :-))

Other than that, I would try experimenting with your CONFIG.SYS file
until you find some combination of drivers that works with ASED. If you
haven't changed your CONFIG.SYS from the last time the two cartridges
worked properly together, then file the above suggestion in the
appropriate location.

I, too, have been having some problems with my SDX cart and certain
hardware/software combinations. These will be documented and a cry for
help will go out next week.

Forgive me if this has been hashed out before:

Is there any way to expand the Atari 800 to more than 48K RAM?
Are there any hard drives out there that would work on an 800? Or at least a floppy drive that can put for than 190K on a disk?

I have the original Atari 800 w/48K. It's served me faithfully for ten years, and I don't want to part with such a longtime and close friend just because of this limitation. If there's help out there, I'd appreciate to have it.

If all else fails, I may resort to getting lotsa disk drives and a second 800, and hacking together some kind of virtual memory/networking/fileserver kludge. Yes, I'm that dedicated to my 800. I can make it do *anything*.

Craig.

P.S. Any solutions which require a soldering iron are not for me. Sorry. :-)

Hans Breitenlohner asked about the Atari Interface Magazine...

AIM is a professionally published magazine that serves as the official newsletter for over 40 Atari users' groups in the USA.

Each month the feature articles are taken from the best of everything written by the participating clubs, and each group also has a section in the back of the magazine to publish their news, announcements and meeting minutes. It's a wonderful alternative to each group trying to print their own newsletter, it lets everyone draw upon the best writing talent in all the groups, and perhaps best of all, it lets everyone see what's going on in all the other groups across the country..!

The magazine includes national ads from all the big vendors and developers, as well as lots of reviews of the latest products.

A subscription is $18/year ($30 for Canadian, $36 for Foreign subscriptions), BUT.. it is FREE with membership in any of the participating users' groups. (In some cases, it's worth joining an Atari user group just to get AIM!)

User groups can participate in AIM and pay only 50 cents per copy.. much less in most cases than trying to print their own newsletter.. and it includes much more than most independant newsletters can come up with.

They've also started distributing a "Disk of the Month" with the best of Public Domain and Shareware programs for the ST, available either as a monthly individual disk subscription, or at a special rate to user groups.

I should have given their mailing address, rather than their phone number as it turns out.. if anyone would like to see a free sample copy of AIM, just send your name and address to:

Unicorn Publications
3487 Braeburn Circle
Ann Arbor, MI 48108

(The delightful little voice that answers the phone also has to edit and manage the magazine, contact the user groups and lay out the ads... answering calls for free samples was just a little too much..! :)

BobR

3157. ATARI Games Carts for sale....

Being right here in the same town with Bob Puff, either I myself or (I imagine) Chris Freemesser at RIT can/will post BobTerm 1.20 up here one of these days. Maybe even this coming week if I can find the time.

3160. UPLOADS COMING THIS WEEK! READ THIS!!!

Newsgroup: comp.sys.atari.8bit
Date: 1990-05-14 03:23:02 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <29888@cup.portal.com>
Source record: 114863

All right, I've seen SO many requests for stuff this week that I
am going to finally get off my butt and take the time to SAVE some
of your collective butts! The following is a list of software which
I intend to upload sometime this week, per the requests and plaintive
cries which have been pouring through comp.sys.atari.8bit and my
e-mailbox over the last few weeks:

1) UUDECODE.BAS -- Atari BASIC _source code_ -- i.e. the listing, non-
tokenized -- so that you can UUdecode a REAL UUdecoder.

2) YAU.COM -- fast UUdecoder so you can unpack the stuff that follows.
Executable binary, in UUencoded form; you must grab item (1) in
order to unpack THIS one, and must grab THIS one in order to
unpack all subsequent items!

3) RVERT212.BIN -- R: handler for SX212 modem "plugged directly into SIO."
Works fine with Kermit65, no visible difference from using the 850.

4) PCUTIL -- the infamous utility to "write Atari disks on the IBM PC."
UUencoded ON THE ATARI, using the YAUE program, companion to
item (2) on this list.

5) PCUTIL -- the same thing, UUencoded on the IBM PC in case your PC
won't UUdecode the Atari-UUencoded one correctly (yes, someone
ASKED for this, specifically).

Individuals who have already sent me e-mail requesting one or another of
these items AS OF RIGHT NOW, will receive their own copies of what they
requested, via e-mail, IF I still have their addresses. Keep your eyes
HERE, though, so you don't miss it, and DON'T send me e-mail NOW if you
HAVEN'T ALREADY. Remember, the more e-mail I have to go through, the
more it will delay my posting the software!

Here's hoping I can pull this off: usually when I plan something this
grandiose, my hardware blows out the day before... :-/

Later,

Chris Chiesa

Craig Lennox asks...
>Forgive me if this has been hashed out before:
>
>Is there any way to expand the Atari 800 to more than 48K RAM?

Yes, several ways - Ramdisk memory cards that go into the slots, Ramdisk
cartridge cards that go in the cart slot, and your own handy dandy upgrades.

>Are there any hard drives out there that would work on an 800? Or at least a
>floppy drive that can put for than 190K on a disk?
Yes, the old Corvus system had an 800 interface. Good luck finding one.
Another possibility is the ATR8000 - I believe it can handle hard disks
as well as floppies with >190k per disk.
And finally there is the XF551 - Atari's most recent disk drive. Using
MYDOS, or SpartDOS you can get 360k on a single disk. Of course, you
could use DOS XE but believe me when I say that DOS XE is just as bad as
DOS 3.

>

Sorry, but while the 800 is a great, well-built machine, it just can't
stand up to the expandability of the XL/XE series.

>If all else fails, I may resort to getting lotsa disk drives and a second

This is unfortunate...if you are really dedicated to the 800 you will need
to HACK it with a soldering iron, hammer, drill, and several other tools.
If you were obsessed with it, you could even make it have all the special
abilities of the XL/XE series.

The VCS used a 6507 CPU, which is basically a 6502 with a shortened address space (8k instead of 64k) and a smaller package. I haven't met anyone who's written for the VCS, but I understand that it can be quite a trick. There is no screen ram in the normal sense. All graphics are accomplished by writing to the graphics chip on the fly. Still interested? :)

If you are, try to get you hands on the Atari Field Service Manual for the VCS. It has schematics, and schematics should give you pretty much what you need to know about addressing the hardware. An in-circuit EPROM emulator would also be a good idea, as I bet you'll be doing a lot of debugging.

What's the project you have in mind?

for game cartriges for it. I don't have a disk drive for it, so I'd like to acquire software on cartridge, if possible.

Does anyone know of any mailorder films that still sell software on cartridge? How about any retail stores - is anyone still selling game cartridges for the XEGS - which I hear are compatible with the normal 800?

Specifically I'm looking for Pole Position, Flight Simulator II, and any sort of military flight simulator (Sublogic JET, MIG Alley Ace, etc.) on cartridge. Can anyone help?

The RF wire on my 800XL is becoming a pain to use, and I'm wondering if there is anyplace I can order a new wire. Or is it possible to hop on over to Radio Shack and just get any old wire with RCA type connectors (since the RF wire uses similar connectors)?

Please send email if possible, since the feed here is somewhat unpredictable.

3168. TRANSKEY -- IBM KEYBOARD MODIFICATION FOR ATARI EIGHT-BITS

Newsgroup: comp.sys.atari.8bit
Date: 1990-05-17 00:51:08 UTC
From: Metalist@cup.portal.com
Message-ID: <29960@cup.portal.com>
Source record: 114871

Hello all! If you did not know, the TRANSKEY is a modification for Atari computers which are eight-bits such as: the 4oo/eight-hundred, 6ooxl, eight-hundred xl, 13oxe, 65xe, 12ooxl, etc.. all eight-bit ATARIS.

It allows you to place a converter board in your ATARI which you in turn plug your IBM XT or AT compatible keyboard
into. [The IBM XT/AT keyboard must have a 5 pin male plug!] Whenever you push a key on the IBM AT keyboard, the converter converts it to the ATARI equivalent and then tricks with the cpu a little, fooling the ATARI into thin king that the ATARI did the keypresses not a IBM keyboard!

I ordered my TRANSKEY mod for $sixty eight. This is the no-solder model, available for computers with "socketed chips". My eight-hundred xl has socketed chips... ! So its very easy for me to install it... If you have soldered chips, ya need the soldering
version, which is ten dollars cheaper [$fifty eight dollars]...

My transkey should be in my hands by June ninth, being that it takes 3-4 week to receive it. If anyone is interested in attaining more information, then leave me mail and I will tell you more about it, and even send you the documentation file if you wish. [This documentation is the same which Ordania-DM has.]

later,

Metalist@cup.portal.com

3169. Atari XE cartridges on sale from Sears

Newsgroup: comp.sys.atari.8bit
Date: 1990-05-18 19:40:06 UTC
From: nin15b0b@merrimack.edu
Message-ID: <19159.26544f96@merrimack.edu>
Source record: 114873

Sears Catalog has the following Atari Hardware/Software catalog on sale.
It is on page 38 of their "CM" catalog and states you can order through
June 2, 1990

product Catalog # price

XE game system 49-CM-65651 $89.97
XF551 disc drive 49-CM-75015 179.97
Hardball 49-CM-65656 19.97
Mario Bros. 49-CM-65668 19.97
Crystal Castle 49-CM-75560 19.97
Desert Falcon 49-CM-75563 19.97
Thunder Fox 49-CM-75564 19.97
Robotron 49-CM-75586 9.97
Archon 49-CM-75587 9.97
Battle Zone 49-CM-75588 9.97
Star Raiders 49-CM-75589 9.97

These are available through Sears Catalog (not Sears Retail), their order
number is 1-800-366-3000

There are also many 2600 carts listed ranging from 6.44 to 18.74 in price.

Thanks for the info. Basically, I just want to play around with assembly, and
thought the VCS would be interesting. I am fluent in IBM/370 and PDP-11 assembly
and am aware of this "writing on the fly" as it pertains to busy-wait I/O on the
PDP-11: I don't even know how screen ram works anyway :-)

Does anyone have an idea on how I can go about getting this manual?
Additionally, If you think this project would be easier/more feasable on a
400/800 (low startup cost is concern #1) please inform me.

Thanks again,

Aron

From: Chris_F_Chiesa@cup.portal.com
Message-ID: <30070@cup.portal.com>
Source record: 114876

Aron Bartle has been asking for information about programming the 2600 (I believe) VCS. I obtained some textfiles off this net (I think) about two years ago, pertaining to exactly that topic. If I can find them, Aron, I'll upload 'em and send you a copy (better hit me with some e-mail at Chris_F_Chiesa@cup.portal.com, in case Portal wipes your news posting before I find the files and have time to UPLOAD them); if there's general interest I can also post them. (BTW, my "software uploads" are not forgotten, but an urgent programming project has kept me sidetracked since just about the time I last posted.)

On the subject of environments for learning to fool with 6502 (or 6507 -- and how is the address space shortened, anyway, if someone knows?) programming, I'd say that the Atari 400 or 800 series of COMPUTER would be much more conducive to this than the VCS: for one thing, the computer offers a keyboard, writable storage media (cassette or disk), and programming environment support software (assemblers, higher-level languages, etc.). You would have to dump assembled or compiled code into ROM for use on the VCS (unless you wanted to get fancy and emulate a cartridge interface in software somehow on a second machine) ANYWAY, so you might as well program where the tools are...

That's my two cents; hope it helps somebody!

Chris

Oops; meant to add a few comments on availability of Atari VCS's and computer systems...

I just attended the Rochester Hamfest and, while quantities are beginning to fall off from past years, I still saw a lot of Atari computers and a few peripherals being sold. Typical computer prices are around $50-60, and I've seen 1050 disk drives for around $80-100. VCS's can be had for as little as $30 on some tables, but heck, at these prices you may as well go "whole hog" and get a computer...

Folks are also frequently selling stuff through the Net, as you doubtless already know.

Yes..! Assembly language is just great on the 8-bit Atari..!

All the advanced features of the computer make it a ball to program, but it's not TOO complex to easily learn to make it do tricks.

Used 800s are not very expensive now, and a new 130XE is about $129.

Assemblers are available from the "basic" Atari Assembler/Editor cartridge to the Atari Macro-Assembler, to other third-party assemblers. Unfortunately most of the last group have pretty much disappeared from the market, but even the AS/EM cartridge isn't bad.

You'll need the book, "Mapping the Atari" from Compute! Books (it will become your "bible"), and a copy of the Atari Technical Users Notes will be very helpful. Again, these can be a little hard to come by.. check the ads in the Atari Interface magazine or ANTIC...

Have fun..!

They all would work on an 800XL as that has 64k, the ones that require
64k wont work on a 400 or 800, since Mario Bros has been around for quite a
while so I would assume it would work on all of them.

Yes, you can use the ST mouse. The pinouts are fine and the connector is just right. Of course, software is the larger issue. I only know of one program that can use the mouse, the Missle Command cartridge. If you type a control-T before starting the game, it sets up the game to use a Trak-ball. Since a mouse is an inverted Trak-ball, it works on a mouse too. I seem to remember the left and right directions were reversed which added challenge to the game.

Howdy, I don't usually read this group but today I did and I may be of help!

In short I designed/built my own 2600 development system (around a 1040ST).
It uses 8K of RAM (Maximum of 4K for cart code... No provisions for bank
switching), or an 8K EEPROM. Graphics editing and disassembly is done on the
ST (a friend of mine wrote a 6502 assembler which I need to add in).

I just recently got the Developers Documentation for the VCS so I haven't
tried to program anything... yet. It looks like a real pain actually.

If anyone wants to chat about VCS stuff, send me E-mail at:

ames!claris!portal!cup.portal.com!Ordania-DM@nyu.edu
ames!claris!portal!cup.portal.com!Metalist@nyu.edu
rfc@philabs.Philips.Com (Robert Casey)
krl@mlb.semi.harris.com (Ken Lyons)

I am presently using a cable I stole off one of my VCRs. There is much less interference than when I was using the old cable (with the exception of an annoying screen pattern, but I think it is relative to the TV, not the computer -- I see it on other channels too), but the colors are slightly washed out -- nothing serious. One thing is for sure -- I need a cable considerably longer than this one (6 feet) -- it's too much of a pain to step over! 8-) Again, thanks to all for your advice and information.

The other program(s) that use the ST mouse is/are the ones done for Alan
Reeves' Diamond GEOS graphics interface for the Atari 8bit machines.
In fact, when the cartridge version was first offered, you could get a
special deal if you bought it and the ST mouse at the same time. His
first attempt was a disk based program, so the mouse driver might be a
separate program on the disk. I don't know. I have a sample disk at
home, but I have only tried it once with an ST mouse. It worked ok.

Hi Gang.

My uploads will be coming shortly so get those queues ready and clear
out some disk space!!!

But first, a couple of questions:

1) Where can I obtain a copy of the "addendum" to the Technical Reference
Notes, which came out when the XL series was introduced? It covered the
changes from the 400/800 series, as I recall, and I actually held a copy
in my hand ONCE, but I'd like a copy of my own.

2) Is there a source of GTIA chips? Believe it or not, I have a friend
whose 800 predates GTIA (it has CTIA), and she would like to upgrade it.
I told her I'd ask you guys, so don't let me down! :-)

Thanks in advance,

Chris Chiesa

|I just recently got the Developers Documentation for the VCS so I haven't
|tried to program anything... yet. It looks like a real pain actually.
|
|If anyone wants to chat about VCS stuff, send me E-mail at:
|
| cowgilc@prism.cs.orst.edu
Where did you get the VCS Dev Docs from?

During the first few months of 1989 three or four messages were posted to
alt.sources concerning programming one of the Atari game systems. I was
trying to retrieve them to repost when my machine crashed. The machine
is still trashed, but if you are interested in getting copies of these
messages send a message to me, by replying to this message, with a Subject

of "ATARI" and i will send them to you when i dig them off of the tapes.

Chris Chiesa asks:
>2) Is there a source of GTIA chips? Believe it or not, I have a friend
>whose 800 predates GTIA (it has CTIA), and she would like to upgrade it.

Call American Techna-Vision at 1-800-551-9995 and ask them about GTIA chips.... and tell them you heard about them through AIM Magazine..

Their May 1990 ad lists a lot of the ICs for the 8-bit Atari computer.. unfortunately I don't have the part number of the GTIA chip handy.. they also list a complete set of LSI chips for the 800XL (including the GTIA) for $16.95...

Sorry if this isn't the right group to ask, but I am trying to find information on the memory expansion cards for the Atari Portfolio for a friend of mine. Three questions: what is the largest memory size available (128K ?), who are the main distributors for Atari products/compatibles and what is the price range. Any advice would be appreciated, especially on low-cost suppliers.

3192. Bobterm 1.20

I just managed to kermit it over here. I was going to ftp it to
terminator, but the 8bit directory doesn't seem to be writable. If someone
can open up the directory, I'll put it in. If I get enough demand, I suppose
I could post it.

That's very easy to fix. Get an ink pad, and roll the ink roller across the
pad a few times. This will serve to re-ink the roller and make it quite
usable for a while.

From: ekarlin@libserv1.ic.sunysb.edu
Message-ID: <10005@sbcs.sunysb.edu>
Source record: 114755

Hello,
I have been using both bobterm and chameleon as terminal programs to
transfer files with...but I have a question

Chameleon uses kermit protocol and I know when to use binary vs. text
mode when transferring files

BUT

Bobterm has the ascii <--> atascii translation...can anyone tell me
when I should use this feature...I read the doc but I still was lost.

I like the 1k-transfer of bobterm but I find it kinda touchy and
a little unreliable..but then again I can't get k-65 to work either!
I hope that this will be the problem...

Please let me know either here or at mail address below. Thanx in advance

RE: using ASCII -> ATASCII in BOBTERM

You use this when you are transferring TEXT files but using X or Y or F
-modem instead of CAPTURE. Do not use it when transferring binary files.

You should not be having any problems with 1k-xmodem. If you are having
problems getting it to work correctly then try rereading the docs, if you
are getting a lot of bad blocks then your telephone line is noisy.

I have an old Atari 800/XL/XE cartridge called Journey to the Planets (from Roklan). I have solved all of the planets except for one. I am looking for help with the planet that has:

1) A rock (ball?) and a box floating in the sky. If you shoot one of them, they come down to the ground via a lightning bolt.
2) A conveyor belt
3) A transporter between the ship and the puzzle area. If you travel through the transporter, you lose whatever you are carrying.

I hope I have adequately described which planet I am stuck on. If you know how to solve this planet, please drop me a line. Thanks. I've been haunted by this for years!

3205. SX212 handler that comes with BobTerm - shareware author

Newsgroup: comp.sys.atari.8bit
Date: 1990-06-13 03:48:46 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <30731@cup.portal.com>
Source record: 114759

Kit Kimes (kimes@cbnewsc.att.com) recently informed us that upon using the SX212 handler that comes with BobTerm, with a DIFFERENT terminal program, "while it is loading a screen comes up briefly that says it is a shareware program, and gives a name and address in Florida." Kit then asks "if Bob Puff sends a portion of the money he receives for BobTerm to him (the SX212-handler author)."

I've exchanged e-mail on this subject with Bob Puff on his BBS (Computer World Jr., at (716) 247-8355) and Bob says that NO, he does NOT forward any money to the author of the SX212 handler, who "has his own shareware agreements" -- apparently a reference to the message Kit mentions.

That's the scoop, Kit and everyone else; if you see that other guy's name, and address, and want him to receive shareware money, SEND IT DIRECTLY TO HIM, not to Bob Puff. Separate products, separate authors, separate contributions.

> and address, and want him to receive shareware money, SEND IT DIRECTLY TO
> HIM, not to Bob Puff. Separate products, separate authors, separate con-
> tributions.

Thanks Chris.

I also received your email, but wanted to add a comment for all to see.
The man's name is James Dillow. I have never seen his name on anything
else, but I don't use a lot of productive or utility type programs.
The SX212 handler is an excellent program and deserves some compensation
for his efforts. Too bad Bob's program doesn't allow James message to
come up. Since Bob mentions in his documentation that the program is
for direct connect SX212 modems, he should also mention that it is
shareware and give the name and address. I don't have the latest issue
of BOBTERM yet, so maybe he has updated this information.

Thanks again. It is good to see that some people continue to support
the 8bit Atari computers. One of these days I'll probably get an ST
(maybe the Advantage Package will push me over the edge) but for now
I am completely content with my 8bit.

>
>AJones

I dug up my archives and found the following modifications to improve the video output on a 1200XL.

Originally Change to

R22 4.3K ohm 6.2K ohms

R188 910 ohm 1N914 diode with cathode towards the bridge rectifier

R163 100 ohm 150 ohm

R145 n/c 18K ohms

I don't have a 1200 XL myself but a member in our Atari Club at work did the mod and was quite pleased.

3213. questions on Atari 8 bits

Newsgroup: comp.sys.atari.8bit
Date: 1990-06-16 08:17:23 UTC
From: nin15b0b@merrimack.edu
Message-ID: <19579.2679eb13@merrimack.edu>
Source record: 114767

I am doing a survey on Atari Software for a Graduate Class.

The information obtained may or may not be used to produce new software for the Atari 8 bit market.

Questions

1. What kind of system hardware do you currently use?

e.g. Computer Type, Modem, Disk Drive, Printer, Hard Drive, Etc?

2. What kind of software do you feel the Atari market is lacking?

e.g. Applications, Telecomunnications, Graphics, Utilities, Etc?

3. Could expand on question 2 and mention specific types of products you would like to see available?

e.g. An application that will do this, this, and this.

4. How much would you be willing to pay for this product?

5. Would you buy this product through the mail, or would you only buy it if it was available through an Atari Dealer in your area?

6. What computer specific magazines do you read regularly?

7. What is your age?

8. What State do you live in?

9. What is your opinion on the 8 bit market, are there enough users out there to support a company producing software for the 8 bit market?

The following questions are optional

10. What is your occupation, if student, where?

11 What is your annual income?

Thanks for your time

Please send replys directly to NIN15B0B@Merrimack.edu

I just found Daisy Dot 3 on a BBS, so I decided to put it up for FTP. Unfortunately, the terminator directory doesn't seem to be writable anymore. Therefore, for a limited time only, you can pick it up from louie.udel.edu [128.175.1.3] in the directory ~ftp/pub/dd3. There are 4 files, all of which must be transferred in binary mode.

3217. Game Questions

Newsgroup: comp.sys.atari.8bit
Date: 1990-06-17 22:37:06 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <30888@cup.portal.com>
Source record: 114771

I recently had the delightful experience of acquiring VERY cheaply a large number of used Atari games. However, as is so often the case with USED software, the manuals, booklets, etc., were long gone (that's how I got them so cheaply). I've been slowly trying to figure them out, and would like to hear about anyone who knows how to play them.

I haven't gotten through many of 'em yet, but I have at least ONE so far that I'd like to ask about:

"FOOBLITZKY" -- seems to have to do with a goofy looking Dog, who wanders around a Monopoly-like board SHOPPING, I think, for I-know-not-what. There are icon-like images at various positions, which appear to be stores and the like, which if landed upon result in the display of various graphic images. There's almost no text in the whole game, so I haven't much of a clue to what's going on.

Oh, one other: "D-BUG". Looks like you're running around inside a computer, trying to "debug" something, but basically that's all I've been able to tell.

Thanks in advance for any help, or for any pointers to help!

Chris

You could try calling Innovative Concepts in Warren, Michigan... their ad
is in this month's Atari Interface magazine..

They do memory upgrades, XF-551 upgrades, and more for the 8-bit Atari...

If you don't have a copy of AIM handy, their phone number is:
(313) 293--0730...

Just a quick note - I recently put Draper Pacsal on terminator, and sent them a copy of util.exe, the infamous Atari <-> IBM xlator. If you want to post to terminator, send a message to jrd@terminator (I think) - he'll ask you to send him the program in uuencoded form, then he'll put it on the server. If that address doesn't work, look in the atari/News directory - there's a note there explaining things.

> I have a 1200xl. When I run "M.U.L.E." it will only let me have 3 players,
> the fourth is always the computer. How is one supposed to play with 4?
>
> AJones

I assume that you haven't modified your XL to include more joystick ports
(The 1200XL, 600XL, 800XL, 65XE, 130XE, and XEGS all come with only 2 joystick
ports; only the 800 and 400 came with 4).

M.U.L.E. needs at least 1 joystick plugged in to move your player around
on the development screen, but the rest of the players may use paddles. Thus,
on a two-port machine, you can only have three players, one joystick in one port, and two
paddles in the other port.

I saw an article in Antic a few years back (I still have the copy at home
somewhere) that "fixed" a color problem on the 800XL. I don't think it was
useable on any other model, but I could check if you really needed to know.

3225. What makes the best monitor?

Newsgroup: comp.sys.atari.8bit
Date: 1990-06-20 13:39:28 UTC
From: krieg@jupiter.uucp
Message-ID: <2699@mrsvr.UUCP>
Source record: 114779

I just moved recently and had to give up the 19" TV I had been using as my 800/XE monitor for the last 9 years. Now I don't have my old system set up all. I'm going into XE withdrawal! Luckily I have my ST set up to keep me from going catatonic.

Anyway, I want to set up the old XE again, and was wondering what is the best monitor for an XE? Does a composite monitor give you significantly better resolution than a TV? I like to play games, so is bigger better (i.e. stick with a 19" TV). Would a 13" TV suffice? What are the best composite monitors currently available? Which have the best resolution?

Any advice is greatly appreciated.

Can you believe it? I have a 400, too! Original membrane keyboard!
16K RAM! 410 cassette player (still works, too!)! How's that for nostalgia?

But, <sigh>, I upgraded(?) to a 65XE, Indus disk drive, Supra modem, Star
printer.

As for cartridges, I saw some at Lionel play-world a LONG time ago, and my
local Atari dealer has some, I'm sure, but I haven't been there since last
year.

3233. European Software

Newsgroup: comp.sys.atari.8bit
Date: 1990-07-08 21:52:46 UTC
From: wilmott@topaz.rutgers.edu
Message-ID: <Jul.8.17.52.41.1990.8701@topaz.rutgers.edu>
Source record: 114787

```
------

Help given :
------------

Just when you thought there was no more software for the Atari 8-bits
to be found, I've found a European source of software which offers
many titles never released in the U.S. The place to write for a free
listing of available software is:

Miles Better Software
219/221 Cannock Road
Chadsmoor, WS11 2DD
England

I know advertisements are usually frowned upon on the net, but with
the serious lack of any new 8-bit software, I figured many out there
would appreciate this info.

Help wanted :
-------------

I ordered 6 games from the above company. 4 work perfectly. 1 works,
but crashes now and then (Joe Blade), and 1 doesn't seem to work
(Rampage). [Rampage boots up, but ignores any joystick input...you
can't control the monsters].

My guess is that the difference between the clock speed of European
machines and US machines is to blame for the seeming incompatibility.
Anybody else out there agree or disagree? Is there anybody out there
who is still into hacking the 8-bit and would like to play around
with "Rampage" to see if they can cure it?

If differences between European and US machines is to blame, I
suppose you are taking a risk when ordering from overseas. Then again,
the prices are so reasonable (nearly all games are priced from
$3.00-$20.00) that the risk is minimal. Hope this info was of help
to someone out there (and also hope maybe someone can help me out :-)

3236. Important Terminator News (name change)

Newsgroup: comp.sys.atari.8bit
Date: 1990-07-14 03:25:11 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <1990Jul14.032511.11436@math.lsa.umich.edu>
Source record: 114790
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.8bit

The Atari Archive at the University of Michigan has grown tired of being called "terminator.cc.umich.edu" and shall now be refered to as "atari.archive.umich.edu". Since certain negative connotations have come to be associated with the name "terminator", we decided that a new name was necessary to improve our self-esteem.

The archive is still at "terminator" for now, but as we get more funding and more machines we will move the archive. The alias atari.archive.umich.edu will then point to the new machine. So, for uniterrupted access to the Atari Archive at the University of Michigan, please direct all mail and ftp traffic to atari.archive.umich.edu.

That is all.

Jon Brode -- jon@atari.archive.umich.edu
Supreme Allied Atari Commander, Michigan

3237. Terminator Name Change Clarification

Newsgroup: comp.sys.atari.8bit
Date: 1990-07-17 22:22:40 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <1990Jul17.222240.16365@math.lsa.umich.edu>
Source record: 114791
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.st.tech

Some people just can't take a joke...

The reason why terminator.cc.umich.edu got changed to atari.archive.umich.edu was technical. The babbling about "negative connotations" and "self esteem" was a joke.

In short:

The machine where the Atari Archive is located is called terminator. It was called terminator before the Atari Archive moved there and will continue to be called terminator after the Atari Archive moves away. It isn't our name. atari.archive.umich.edu is our name and whatever machine we use in the future will inherit the name. This allows us to move the archive transparently. You can use terminator.cc.umich.edu if you like, but one day it will stop working. atari.archive.umich.edu will work until the archive goes away.

Now stop sending me mail about how y'all liked terminator better!

Jon

3238. 8-bit system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1990-07-18 23:18:29 UTC
From: ekrimen@wet.UUCP
Message-ID: <1347@wet.UUCP>
Source record: 114793
Cross-posted to: comp.sys.atari.8bit,ba.market.computers

ATARI 8-BIT SYSTEM FOR SALE!

Hardware:
* 1200XL Computer -- all original packaging (box, styrofoam,
no plastic wrapping bag), power adaptor,
RF modulator, cable to connect RF modulator
to computer console

* 1050 Disk Drive -- all original packaging (box, styrofoam,
plastic wrapping bag), power adaptor,
cable for connecting to computer, DOS 3

* 1010 Program Recorder -- original box (no styrofoam or
plastic wrapping bag), cable to
connect to computer or daisy-chain
to disk drive, power adaptor

* Koala Pad Touch Tablet -- original box and styrofoam (no
plastic wrapping bag), Koalapainter
software cartridge, drawing stylus.
No manual, but it is very easy to
learn. If you need help, ask me.

Software:
* Flight Simulator II
(with all original disks, box, all maps, and manuals)
* Frogger (cartridge in original box with manual)
* Ghostbusters (with original disk, manual, and box)
* Chatterbee (Spelling Bee with S.A.M. Speech Synthesis)
(with original disk, manual, and box)
* Squish 'Em game (cartridge with original box and manual)
* Two BASIC cartridges

* 10 Dysan 5-1/4" DS/DD disks,
mostly filled with magazine type-in programs
* 10 Xidex 5-1/4" DS/DD disks,
mostly filled with magazine type-in programs
* 20 blank generic 5-1/4" disks

Everything is in excellent condition, just like new. I used it to do a
little BASIC programming and play games from time to time. I'm selling it
because I don't use it any more. It just sits there, all bundled up in its
boxes. I'd like to sell it all together for $400, but I will accept any
reasonable offers. I will also accept offers that split the package
up. It is better than any reconditioned set-up. You will be very

pleased with it. I will pay shipping within the U.S.

If interested, leave message here, call me at 415-751-3693 evenings,
or e-mail at ekrimen@wet.UUCP (I think).

3239. Re: UUCP for Atari 8-bit wanted

Newsgroup: comp.sys.atari.8bit
Date: 1990-07-19 01:42:48 UTC
From: Makey@Logicon.COM
Message-ID: <715@logicon.com>
Source record: 114792

Well, I got a total of 3 responses to my request for UUCP for the 8-bit:

(1) A pointer to an implementation for the Atari ST, but which would probably be difficult to port to an 8-bit.

(2) Someone said that UUCP wouldn't fit on an 8-bit and that I should transfer files using kermit. [I have kermit, but that won't help me send e-mail.]

(3) A suggestion that I might try porting UUPC, but it would be difficult.

So, the answer seems to be that UUCP does not currently exist for the 8-bit (quit pretending to be surprised!).

If I get sufficiently motivated, I just might write my own program that will let me exchange mail via UUCP. I have a copy of John Gilmore's freeware "uuslave" program which (assuming it really works) will tell me how to do the protocol. It doesn't look that complicated. Don't hold your breath waiting for me to do this, however. I might decide that it's easier to buy a '386 box.

ATARI 8-BIT SYSTEM FOR SALE!

Hardware:

* 1200XL Computer ($75) -- all original packaging (box, styrofoam), power adaptor, RF modulator, cable to connect RF modulator to computer console

* 1010 Program Recorder ($20) -- original box, cable to connect to computer or daisy-chain to disk drive, power adaptor

* Koala Pad Touch Tablet ($20) -- original box and styrofoam (no plastic wrapping bag), Koalapainter software cartridge, drawing stylus. No manual, but it is very easy to learn. If you need help, ask me.

Software:

* Ghostbusters (with original disk, manual, and box) - $10
* Chatterbee (Spelling Bee with S.A.M. Speech Synthesis) - $10 (with original disk, manual, and box)
* Squish 'Em game (cartridge with original box and manual) - $5

* Two BASIC cartridges - $2.50 each

* 10 Dysan 5-1/4" DS/DD disks, filled with programs --l
* 10 Xidex 5-1/4" DS/DD disks, filled with programs --l-- $10 total
* 20 blank generic 5-1/4" disks --l

Everything is in excellent condition, just like new. I used it to do a little BASIC programming and play games from time to time. I'm selling it because I don't use it any more. It just sits there, all bundled up in its boxes, waiting for someone to take it. The prices I have listed are suggested; negotiate with me and we'll see what happens. These components are better than reconditioned ones, since it's virtually unused. You will be very pleased with it. I will pay shipping within the U.S.

If interested, leave message here, call me at 415-751-3693 evenings, or e-mail at ekrimen@wet.UUCP.

3242. Assistance needed in printing colour pictures using OKIMATE 20

Newsgroup: comp.sys.atari.8bit

From: richardn@sdd.hp.com
Message-ID: <1990Jul29.202655.26709@sdd.hp.com>
Source record: 114797

I am going to make an atari I/O to RS-232 interface so that I can print
from my 1200XL to an HP printer (on RS-232). Has anyone done this before?
Can you help save me some trouble? It looks like the protocols aren't
too different, but I may have to do some signal massaging... Any advice
would be very appreciated!

Thanks.

Cheapest way - buy an ICD P:R:Connection.
I got mine for $40 where I have seen 850's for $70-$100 or more (but that
was several years ago).

Also, Supra makes a Supraverter that is supposed to do the same thing.

Hi there,

I am interested in buying your 1050 disk drive, if you haven't sold it
already.

Can we do a little bargaining? Howzabout $70 for the drive?
Please Email your response. Thanks.

By the way, I was wondering if you were aware that MYDOS is shareware,
and that you can't sell the product without the expressed consent of
Bob Puff (I assume that you paid the shareware fee and thus are a registered
user).

3251. Flakey 130XE keyboard

Newsgroup: comp.sys.atari.8bit
Date: 1990-08-22 20:43:49 UTC
From: rac@sherpa.UUCP
Message-ID: <306@sherpa.UUCP>
Source record: 114805

A friend has a 130XE with a flakey keyboard. The symptoms are:

Anywhere from 5 - 15 minutes after powering on, the keyboard stops working, but not completely. You just have to press very hard to get the keys to register.

Powering off then back on has no effect if the power-on is immediate. The unit must remain off for awhile to have any effact.

This sounds sorta like a heat problem and sorta like a mechanical problem. Does anyone have any suggestions for him.

Thanks.

3252. Atari.archive.umich.edu address change

Newsgroup: comp.sys.atari.8bit
Date: 1990-08-23 02:40:34 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <1990Aug23.024034.1023@math.lsa.umich.edu>
Source record: 114806
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.os.minix

For those of you ftp'ing to the numeric address 35.1.33.8 to reach the
archives on atari.archive.umich.edu (ne terminator.cc.umich.edu), the
planned address change should be in effect by Monday, August 27, at 11am.
(Eastern time.) The new address will be 141.211.164.8. If your site
uses a name resolver, and you ftp to the domain name and not the
numeric address, you should get the new address automagically.

I have two questions regarding some shareware editors:

1) Does anyone have the docs for the SPEEDSCRIPT 3.0 editor? I think it was published in COMPUTE! many years ago; it's a great little word processor, but I haven't been able to figure out the less obvious features.

2) I have recently switched to SPARTADos X, and I can't seem to run the TEDIT text editor. I tried loading both with and without the X command. Can anyone give me a hand?

Thanks in advance,

Paulito N. Mendoza

It sounds like you are slowly frying your keyboard. When I had my
130XE, I too went crazy trying to figure out what was wrong. First step...
open your computer (warranty -- we don't need no stinking warranty ;-). Care-
fully pull the "ribbon" from the keyboard connection on the motherboard. Clean
the runs with a soft cloth (e.g. paper towel) with a solution of mild soap and
water. (I used Ivory dish washing liquid.) Rinse the runs and dry them. Now
find R95 on the motherboard (somewhere near the keyboard connector). In some
models, Atari in its infinite wisdom (yeah, right :-) chose to use a resistor
of smaller value than really required. Thus more current gets through than
should normally be allowed through runs of conductive paint. Unfortunately, I
don't remember the value of the resistor I used to replace R95. Try 1K and
see what happens. You want something at least twice the resistance of the
existing resistor (220 Ohms), but not so strong that you can no longer see the
power LED.

>This sounds sorta like a heat problem and sorta like a mechanical
>problem. Does anyone have any suggestions for him.

One of my old XEs had this problem. (I guess it just comes from
normal use.)

I took my keyboard apart and cleaned the rubber key things (They look
like the letter Y). I guess they get dusty. Again, I don't know why
the keys would work sometimes and not other times... but I had the
same symptoms and what I just explained fixed MY problem keyboard.

I also had a problem with the little plastic sheet with the current
lines on it eventually cracking in certain places. I didn't want to
solder the thing because I was afraid the heat would actually MELT
AWAY more of the plastic.

I eventually just cut a paperclip (small paperclip) to get about a
1/4" section and then I just stuck that on top of where the gap was.
I guess any open wire would work.

My main problem was blowing the PIA chip by getting sloppy while
making gadgets hardware devices to plug into the joystick ports.
It's amazing what nifty things you think of when you have 8 8bit
computers... most with 4 joystick ports!

3259. Looking for 400, or ST software for kids

Newsgroup: comp.sys.atari.8bit
Date: 1990-08-24 22:46:40 UTC
From: don@col.hp.com
Message-ID: <20770001@col.hp.com>
Source record: 114813

Can anyone point me to a place that might still have a (used) Atari 400
for sale? I got rid of mine when I upgraded to an 800 years ago, and
just recently decided that my nephew is getting to the age when he
would be interested in playing with computers, but since he is pre-school
age, I think the membrane keyboard would be better for him. (He's not
allowed to bang on his mother's ST keyboard yet). So far I've only
found an ad that offers parts to repair the old 400 and 800's.

The other reason for choosing the 8 bit line instead of going with the ST
is that there appears to be more software (games, educational programs, etc)
geared for small children available for the 8 bit line than for the ST.
If someone knows of a good source of ST software for children, I would
appreciate hearing about that too.

Thanks!
Don Allison

ATARI SAFARI - - COMPUTER SHOW!

The newest from ATARI.
Demonstrations.
User groups.

SWAP MEET.

Saturday September 1, 1990
1:00 pm - 6:00 pm
Place: QUALITY INN.
Southwest Freeway (US-59) and Weslayan.
HOUSTON, TEXAS

****
** FREE Admission!!!!!! **
****

For information, contact: Bill Kithas, HACE president (713) 855-0815(home)
or 650-1994(office). Houston Atari computer user groups are sponsoring
the largest Atari computer show ever held in South Texas.

ATARI SAFARI '90 will feature the newest in Atari computers and software.
This show, to be held in southwest Houston, will offer demonstrations in
word processing, desktop publishing, MIDI music, computer graphics and games.

BOB BRODIE, of Atari Corporation, will demonstrate several of the newest
products: the STACY, a lap-top that can operate Macintosh software; the
PORTFOLIO, an MS-DOS hand held computer; the LYNX, a hand held color-screen
game game machine, and the STE, the newest in the full-size line of computers.
The STE features increased speed and enhanced graphics capabilities.

In addition to the demonstrations, the show will feature hardware and software
displays, and a SWAP MEET for used computers and related items.

Representatives from several computer groups will be available to help
people select a low-cost computer system for business, travel or home use.

The show, hosted by the HOUSTON ATARI COMPUTER ENTHUSIASTS, will begin at
1:00 pm on Saturday, September 1, at the Quality Inn on the Southwest Freeway
and Weslayan, just south of the Summit.

TABLE INFORMATION

User group information tables. Literature and sign up members. NO SALES,
no cost.

SALES tables for: User group; Vendors; Swap meet tables. $10.00 table
charge. Door prize donations may be substituted for table charge.

TABLE RESERVATION DEADLINE is AUGUST 30, 1990.
Make reservations by calling
(713) 988-3712.

NOTE: Originally the entry fee to ATARI SAFARI '90 was set at $2.00 in
order to cover the room costs. The room costs have since been
covered by DOUBLE CLICK SOFTWARE, which is located in Houston,
so entry is now FREE!!! Thanks go to DOUBLE CLICK.

3263. 1200XL video/RS-232 interface/thank you

Newsgroup: comp.sys.atari.8bit
Date: 1990-08-27 16:17:52 UTC
From: richardn@sdd.hp.com
Message-ID: <1990Aug27.161752.21525@sdd.hp.com>
Source record: 114816

Hello all Atari 8-bit people:

This is a thank you and a recap note.

I posted a note asking about an RS-232 to Atari interface, and got lots
of good responses. What I ended up doing is buying an interface from
someone on the net. It wasn't the ICD PR connection or the Atari 850.
I had to modify my 1200XL so that pin 10 on the Atari connector would
supply enough current: Short R63 on the 1200XL PCBoard.

Also, I did the video modification suggested earlier:

Originally Change to

R22 4.3K 6.2K

R188 910 ohm 1N914 diode with cathode towards
bridge rectifier

R163 100 ohm 150 ohm

R145 n/c 18K ohms

The video is a bit better, but it's not a huge improvement (it wasn't
too bad to begin with)

Everything works, and better than before. Thanks to:

AAron nAAs

3264. AtariLab interface

Newsgroup: comp.sys.atari.8bit
Date: 1990-08-28 13:15:16 UTC
From: jtmorgan@sun.udel.edu
Message-ID: <13673@sun.udel.edu>
Source record: 114818

Hello 8bitters!

I need some info on an AtariLab Interface. Is this just some type
of junction box or does it have chips like the 850 interface?

If anyone has one of these and would like to get rid of it a couple of
kids would love to have it so that they can use it with an 800XL.

Also if anyone has a schematic to it that would be just fine.

Thanks to all!

Howdy,

I don't believe that I am qualified to answer your query (I don't
have much experience with the XEP80 80 column driver, and I don't know
the basic theory behind software-driven 80-column applications), but
I did feel the need to compliment you on your Bart Simpson.
Very nice.

3268. SPEEDSCRIPT 3.0 docs

Newsgroup: comp.sys.atari.8bit
Date: 1990-08-29 01:41:00 UTC
From: pm16579@uxa.cso.uiuc.edu
Message-ID: <49700040@uxa.cso.uiuc.edu>
Source record: 114822

A couple of people have asked me to post this, so here goes. It is the original docs (minus a coupla paragraphs, and configured for an Epson printer) for SpeedScript 3.0. Hopefully, the control characters for underline and italics will transfer OK.

----------cut here----------

SPEEDSCRIPT 3.0

All machine language processor for Atari
originally printed May, 1985 COMPUTE!
1985 Charles Brannon, Program Editor
documentation by Paulito Mendoza 1990

4SpeedScript 3.0,5 though compact in size (8K), has many features found on commercial word processors. 4SpeedScript5 is also very easy to learn and use. You type in everything first; preview and make corrections on the screen; insert and delete words, sentences, and paragraphs; then print out an error-free draft, letting 4SpeedScript5 take care of things like margins, centering, headers and footers.

-1ENTERING TEXT-0

When you run 4SpeedScript5, the screen colors change to black on white. The first line on the screen is black with white letters. 4SpeedScript5 presents all commands on this 4command line5. The remaining 18 lines of the screen are used to enter, edit, and display your document. 4SpeedScript5 makes use of a special but little-used Atari character mode that permits larger, more readable characters with true lowercase descenders. The screen still shows up to 40 columns; only five rows are sacrificed. We think you'll agree that this is the most readable text you've ever seen on an Atari--perfect for word processing. (Technical note: 4SpeedScript5 starts at $1F00, and the ANTIC 3 character set is embedded at $2000.)

The cursor, a blinking square, shows where the next character you type will appear on the screen. 4SpeedScript5 lets you move the cursor anywhere within your document, making it easy to find and correct errors.

To begin using 4SpeedScript5, just start typing. When the cursor reaches the right edge of the screen, it automatically jumps to the beginning of the next line, just as in BASIC. But unlike BASIC, 4SpeedScript5 never splits words at the right edge of the screen. If a word you're typing won't fir at the end of one line, it's instantly moved to the next line. This feature, called 4word-wrap5 or 4parsing5, also helps to make your text more readable.

-1SCROLLING AND SCREEN FORMATTING-0

When you finish typing on the last screen line, 4SpeedScript5 automatically scrolls the text upward to make room for a new line at

-1SPEEDSCRIPT 3.0 documentation page 2-0

the bottom. Imagine the screen as an 18-line window on a long, continuous document. If you've unplugged all cartridges or disabled BASIC, there's room in memory for 3328 characters of text with 24K of RAM and up to 27,904 characters on a 48K machine. (Unfortunately, 4SpeedScript 3.05 cannot make use of the extra memory available in the XL and XE series.) An additional 2K of text memory is available if 4SpeedScript5 is loaded from a boot tape. To check at any time how much unused space is left, press CTRL-U (hold down the CTRL key while pressing the U key.) The number appearing in the command line window indicates how much 4unused5 room remains for characters of text.

If you're used to a typewriter, you'll have to unlearn some habits if this is your first experience with word processing. Since the screen is only 40 columns wide, and most printers have 80- and 132-column carriages, it doesn't make sense to press RETURN at the end of each line as you would on a typewriter. 4SpeedScript's5 word-wrap takes care of this automatically. Press RETURN only when you want to force a carriage return to end a paragraph or limit the length of a line. A 4return mark5 appears on the screen as a crooked left-pointing arrow.

-1USING THE KEYBOARD-0

Most features are accessd with control-key commands--you hold down CTRL while pressing another key. In this article, control-key commands are abbreviated CTRL-4x5 (where 4x5 is the key you press in combination with CTRL.) An example is the CTRL-U mentioned previously to check on unsued memory. CTRL-E means hold down CTRL and press E. Sometimes you must also hold down th OPTION button to select a special option of a command, such as OPTION-CTRL-H. Other keys are referenced by name or function, such as DELETE/BACK S for the backspace key, CTRL-CLEAR for the clear screen key, and 4cursor-left5 or CTRL-+ for the cursor left key. See the chart at the end of this document for a complete reference of all keyboard commands.

Some keys let you move the cursor to different places in the document to make corrections or scroll text into view. You can move the cursor by character, word, sentence, or paragraph. Here's how to control the cursor:

The CURSOR LEFT/RIGHT keys (CTRL-+ and CTRL-*) work as usual; pressing CTRL-* moves the cursor right (forward) one space, and CTRL-+ moves the cursor left (backward) one space.

The CURSOR UP/DOWN keys (CTRL-minus and CTRL-=) move the cursor to the beginning of either the next or previous sentence. Press CTRL-minus to move the cursor up (backward) to the beginning of the previous

sentence. Press CTRL-= to move the cursor down (forward) to the beginning of the next sentence.

SHIFT-+ moves the cursor left (backward) to the beginning of the previous word. SHIFT-* moves the cursor right (forward) to the

-1SPEEDSCRIPT 3.0 documentation page 3-0

beginning of the next word. If you get confused, just look at the arrows on the keys as a reminder.

SHIFT-minus moves the cursor up (backward) to the beginning of the previous paragraph. SHIFT-= moves the cursor down (forward) to the beginning of the next paragraph. Again, look at the arrows on these keys for a reminder. A paragraph always ends with a return-mark.

The START button, pressed once, moves the cursor to the top (start) of the screen without scrolling. Pressed twice, it moves the cursor to the beginning of the document.

CTRL-Z moves the cursor to the end of the document, scrolling if necessary. It's easy to remember since Z is at the end of the alphabet.

For special applications, if you ever need to type the actual character represented by a command or cursor key, press ESC before typing the CTRL key. Press ESC twice to get the ESCape character, CHR$(27).

-1CORRECTING YOUR TYPING-0

Sometimes you'll have to insert some characters to make a correction. Use CTRL-INSERT to open up a single space, just as in BASIC. Merely position the cursor at the point where you want to insert a space, and press CTRL-INSERT.

It can be tedious to use CTRL-INSERT to open up enough space for a whole sentence or paragraph. For convenience, 4SpeedScript5 has an insert mode that automatically inserts space for ech character that you type. In this mode, you can't type over characters; everything is inserted at the cursor position. To enter insert mode, press CTRL-I . To cancel insert mode, press CTRL-I again. To let you know that you are in insert mode, the black line at the top of the screen turns blue.

Insert mode is the easiest way to insert text, but it can become too slow when inserting near the top of a very long document because it must move 4all5 the text following the cursor position. So 4SpeedScript5 has even more ways to insert blocks of text.

One way is to use the TAB kay. It is programmed in 4SpeedScript5 to act as a five-space margin indent. To end a paragraph and start another, press RETURN twice and press TAB. TAB always inserts; you don't need to be insert mode. You can also use TAB to open up more

space then CTRL-INSERT. (You cannot set or clear tap stops in 4SpeedScript5 as you can in the noraml screen editor.) No matter how much space you want to insert, each insertion takes the same amount of time. So the TAB key can insert five spaces five times faster than pressing CTRL-INSERT five times.

-1SPEEDSCRIPT 3.0 documentation page 4-0

There's even a better way, though. Press SHIFT-INSERT to insert 255 spaces (It does not insert a line; use RETURN for that.) You can press it several times to open up as much space as you need. And SHIFT-INSERT is 4fast.5 It inserts 255 spaces as fast as CTRL-INSERT opens up one space. Now just type the text you wanted to insert over the blank space. (You don't want to be in CTRL-I insert mode when you do this trick; that would defeat its purpose.)

Since the DELETE/BACK S key (backspace) is also slow when working with large documents (it, too, must move all text following the cursor), you may prefer to use the cursor-left key to backspace when using this method.

After you're done inserting, there may be some inserted spaces left over that you didn't use. Just press SHIFT-DELETE/BACK S. This instantly deletes all extra spaces between the cursor and the start of the following text. It's also useful whenever you need to delete a block of spaces for some reason.

-1ERASING TEXT-0

Press DELETE/BACK S by itself to erase the character to the left of the cursor. All the following text is pulled back to fill the vacant space.

Press CTRL-DELETE/BACK S to delete the character on which the cursor is sitting. Again, all the following text is moved toward the cursor to fill the empty space.

These keys are fine for minor deletions, but it could take all day to delete a whole paragraph this way. So 4SpeedScript5 has two commands that can delete an entire word, sentence, or paragraph at a time. CTRL-E erases text 4after5 (to the right of) the cursor position, and CTRL-D deletes text 4behind5 (to the left of) the cursor.

To use the CTRL-E erase mode, first place the cursor at the beginning of the word, sentence, or paragraph you want to erase. Then press CTRL-E. The command line shows the message "Erase (S,W,P): RETURN to exit". Press S to erase a sentence, W for a word, or P for a paragraph. Each time you press one of these letters, the text is quickly erased. You can keep pressing S, W, or P until you've erased all the text you wish. Then press RETURN to exit the erase mode.

The CTRL-D delete mode works similarly, but deletes only one word, sentence, or paragraph at a time. First, place the cursor after the word, sentence, or paragraph you want to delete. Then press CTRL-D. Next, press S, W, or P for sentence, word, or paragraph. The text is immediately deleted and you return to editing. You don't need to press RETURN to exit the CTRL-D delete mode unless you pressed this key by mistake. 4(In general, you can escape from any command in 5SpeedScript4 by simply pressing RETURN.)5 CTRL-D is most convenient

when the cursor is already past what you've been typing.

-1THE TEXT BUFFER-0

When you erase or delete with CTRL-E and CTRL-D, the text isn't lost forever. 4SpeedScript5 remembers what you've removed by storing deletions in a separate area of memory called a 4buffer.5 The buffer is a failsafe device. If you erase too much, or change your mind, just press CTRL-R to restore the deletion. However, be aware that 4SpeedScript5 remembers only the last erase or delete you performed.

Another, more powerful, use of this buffer is to move or copy sections of text. To move some text from one location to another, first erase or delete it with CTRL-E or CTRL-D. Then move the cursor to where you want the text to appear and press CTRL-R. CTRL-R instantly inserts the contents of the buffer at the cursor position. If you want to copy some text from one part of your document to another, just erase or delete it with CTRL-E or CTRL-D, restore it at the original position with CTRL-R, then move the cursor elsewhere and press CTRL-R to restore it again. You can retrieve the buffer with CTRL-R as many times as you like. If there is no room left in memory for inserting the buffer, you'll see the message "MEMORY FULL."

Important: The CTRL-E erase mode lets you erase up to the maximum size of the buffer (2K for disk, about 6K for tape), and CTRL-E also removes the previous contents of the buffer. Keep this in mind if there's something in the buffer you'd reather keep. If you don't want the buffer to be erased, hold down the OPTION key while you press CTRL-E. This preserves the buffer contents and adds newly erased text into the buffer. If you ever need to erase the contents of the buffer, press CTRL-K (4kill buffer.5)

-1THE WASTEBASKET COMMAND-0

If you want to start a new document, or simply obliterate all your text, hold down OPTION while you press SHIFT-CLEAR (that's not a combination you're likely to press accidentally). 4SpeedScript5 asks, "ERASE ALL TEXT: Are you sure? (Y/N)." This is your last chance. If you 4don't5 want to erase the entire document, press N or any other key.Press Y to perform the irreversible deed. There is no way to recover text wiped out with Erase All.

-1SEARCH AND REPLACE-0

4SpeedScript5 has a Fine command that searches through your document to find a selected word or phrase. A Change option lets you automatically change one word to another throughout the document.

OPTION-CTRL-F (4find5) activates the search feature, OPTION-CTRL-C (4change5) lets you selectively search and replace, and CTRL-G

-1SPEEDSCRIPT 3.0 documentation page 6-0

(4global5) is for automatically searching and replacing.

Searching is a two-step process. First you need to tell 4SpeedScript5 what to search for, then you trigger the actual search. Hold down OPTION and press CTRL-F. The command line prompts "Find:" Type in what you'd like to search for, the 4search phrase5. If you press RETURN alone without typing anyhting, the Find command is cancelled.

When you are ready to search, press CTRL-F. 4SpeedScript5 looks for the next occurrence of the search phrase 4starting from the current cursor position.5 If you want to hunt through the entire document, press START twice to move the cursor to the very top before beginning the search. Each time you press CTRL-F, 4SpeedScript5 looks for the next occurrence of the search phrase and places the cursor at the start of the phrase. If the search fails, you'll see the message "Not found."

CTRL-C works together with CTRL-F. After you've specified the search phrase with OPTION-CTRL-F, press OPTION-CTRL-C to select the replace phrase. (You can press RETURN alone at the "Change to:" prompt to select a 4null5 replace phrase. When you hunt and replace, this deletes the located phrase.) To manually search and replace, start by pressing CTRL-F. After 4SpeedScript5 finds the seach phrase, press CTRL-C if you want to replace the phrase. If you don't wnat to replace the phrase, don't press CTRL-C. You are not in a special search and replace mode. You're free to continure writing at any time.

CTRL-G links CTRL-F and CTRL-C together. It first asks "Find:", then "Change to:", then automatically searches and replaces throughout the document starting at the cursor position.

There are a few things to watch out for when using search and replace. First, realize that if you search for "the," 4SpeedScript5 finds the embedded "the" in words like "therefore" and "heathen." If you changed all occurrences of "the" to "cow," these words would become "cowrefore" and "heacown." If you want tofind a dingle word, include a space as the first character of the word, since almost all words are preceded by a space. Naturally, if you are replacing, you need to include the space in the replace phrase, too.

Also, 4SpeedScript5 distinguishes between upper- and lower-case. The word "Meldids" does not match with "meldids." 4SpeedScript5 will not find a capitalized word unless you capitalize it in the search phrase. To cover all bases, you will sometimes need to make two passes at

replacing a word. Keep these things in mind when using CTRL-G, since you don't have a chance to stop a global search and replace.

-1STORING YOUR DOCUMENT-0

Just press CTRL-S to store a document. You'll see the prompt "Save :

-1SPEEDSCRIPT 3.0 documentation page 7-0

(Device:Filename)>". Type C; for cassette or D: plus a legal Atari filename for disk. If you use the same name as a file already on disk, that file will be replaced by the new one. CTRL-S always saves the entire document. The cursor position within the document is not important.

When the SAVE is complete, 4SpeedScripto reports "no errors" if all is well, or gives a message like "Error #144" if not.5 Check your DOS or BASIC manual for a list of error numbers and their causes.

-1LOADING A DOCUMENT-0

To recall a previously saved document, press CTRL-L. Answer the "Load: (Device:Filename)>" prompt with the filename. Again, remember to include the C: for cassette or D: for disk. 4SpeedScript5 loads the file and should display "no errors." Otherwise, 4SpeedScript5 reports the error number.

4The position of the cursor is important before loading a file.5 Documents start loading at the cursor position, so be sure to press START twice or OPTION-SHIFT-CLEAR (Erase All) to move the cursor to the start of the text, unless you want to merge two documents. When you press CTRL-L to load, the command line turns green to warn you if the cursor is not at the top of the document.

To merge two or more files, simply load the first file, press CTRL-Z to move the cursor to the end of the document, and then load the file you want to merge. Do not place the cursor somewhere in the middle of your document before loading. A Load does not insert the text from tape or disk, overwrites all text after the cursor position. The last character loaded becomes the new end-of-text pointer, and you cannot access any text that appears ahead of this pointer.

Since 4SpeedScript5 stores files in ASCII (American Standard Code for Information Interchange), you can load any ASCII file with 4SpeedScript5. You could write a BASIC program with 4SpeedScript5, save it on disk, then use ENTER to read the file from BASIC. In BASIC, you can store a program in ASCII form with LIST "D:filename" for disk or LIST "C:" for tape, ready to load with 4SpeedScript5. You can even load files produced by most other word processors, and most word processors can read 4SpeedScript5 files. You can make full use of 4SpeedScript's5 editing features to prepare ASCII files for the Atari 4Assembler/Editor, MAC/65, 5and most other Atari assemblers. And 4SpeedScript5 files can be transferred via modem with your favorite

telecommunications program that handles ASCII (such as "JTERM," published in the January 1985 issue of COMPUTE!).

-1DISK COMMANDS-0

Sometimes you forget the name of a file, or need to delete or rename a file. 4SpeedScript5 provides a unique miniDOS for your convenience.

-1SPEEDSCRIPT 3.0 documentation page 8-0

Just press CTRL-M (4menu5). 4SpeedScript5 reads the entire disk directory and puts it on the screen in three columns. A large cursor shows you which file is currently selected. Use the cursor keys to move the cursor to the file you want to select. A menu at the bottom of the screen shows you what keys you need to press. Press CTRL-D to delete the selected file, R to rename, L to Lock, U to unlock, or F to format the disk. You can load the selected file by pressing CTRL-L. The position of the cursor is not important when loading a file from the menu--4SpeedScript5 always erases anything you previously had in memory.

Any changes you make to the directory will not show up until you call the directory again. Press 1,2,3 or 4 to update the directory from drive 1-4. This also sets the default disk drive, the drive accessed for further changes. When you're ready to return to writing, press either ESC or the RETURN key.

-1ADDITIONAL FEATURES-0

4SpeedScript5 has a few commands that don't do much, but are nice to have. CTRL-X exchanges the character under the cursor with the character to the right of the cursor. Thus you can fix transposition errors with a single keystroke. CTRL-A changes the character under the cursor from uppercase to lowercase or vice versa.

Press CTRL-B to change the background and border colors. Each time you press CTRL-B, on eof 128 different background colors appears. Press CTRL-T (4text5) to cycle between one of eight text luminances. The colors are preserved until you cahnge them or reboot 4SpeedScript.5

If your TV suffers from 4overscanning5, some characters on the left or right margin may be chopped off. Atari 4SpeedScript5 lets you widen and narrow the width of the screen. Press OPTION-CTRL-+ (the cursor left key) to decrease the width of the screen. Each time you press it, the text is reformatted, and the left and right screen margins are adjusted by one character. You can decrease the width all the way down to two characters (although if your screen overscans that much, it's time to buy a new TV). To increase the width, up to a maximum of 40 (the default width), press OPTION-CTRL-* (the cursor right key).

One disadvantage of word wrapping is that it's hard to tell exactly how many spaces are at the end of a screen line. When a word too long

to fit on a line is wrapped to the next line, the hole it left is filled with "false" spaces. That is, the spaces are not actually part of your text, and won't appear on paper. If you want to distinguish between true spaces and false spaces, press CTRL-O (4on/off5). The false spaces become tiny dots. You can write and edit in this mode if you wish, or turn off the feature by pressing CTRL-O again.

Atari 4SpeedScript5 disables the BREAK and inverse video keys when you're entering or editing text. The inverse video key was disabled

-1SPEEDSCRIPT 3.0 documentation page 9-0

because it is frequently pressed by accident on the 800 and 800XL models. If you want to enter inverse video characters, hold down SELECT while typing the keys.

Atari 400 and 800 owners will notice that the action of the CAPS/LOWR key has been changed in 4SpeedScript5. It works like the CAPS key on the XL and XE models. Press it once to switch to uppercase, and again to switch to lowercase. In other words, the CAPS/LOWR key toggles between upper- and lowercase. You can still use SHIFT-CAPS/LOWR to force entry to all uppercase. CTRL-CAPS/LOWR has no effect.

Pressing SYSTEM RESET returns you to 4SpeedScript5 without erasing your text when using Atari DOS. With OS/A+ DOS, SYSTEM RESET returns you to the DOS prompt. You can get back to 4SpeedScript5 without losing any text if you type RUN at the prompt.

-1PRINT!-0

If you already think 4SpeedScript5 has plenty of commands, wait until you see what the printing package has to offer. 4SpeedScript5 supports an array of powerful foramtting features. It automatically fits your text between left and right margins you can specify. You can center a line or block it against the right margin. 4SpeedScript5 skips over the perforations on continuous-form paper, or can wait for you to insert single-sheet paper. A line of text can be printed at the top of each page (a 4header5) and/or at the bottm of each page (a 4footer5), and can include automatic page numbering, starting with whatever number you like.

4SpeedScript5 can print on different lengths and widths of paper, and single-, double-, triple-, or any spacing is easy. You can print a document as big as can fit on a tape or disk by linking several files together during printing. You can print to the screen or to a file instead of a printer. Other features let you send special codes to the printer to control features like underlining, boldfacing, and double-width type (depending on the printer).

But with all this power comes the need to learn additional commands. Fortunately, 4SpeedScript5 sets most of these variables to a default state. If you don't change these settings, 4SpeedScript5 assumes a

left margin of five, a right margin of 75, no header or footer, single-spacing, and continuous- paper feeding. You can change these default settings, if you want (see below). Before printing, be sure the paper in your printer is adjusted to top-of-form (move the paper perforation just above the printing element). One additional note: some printers incorporate an automatic skip-over-perforation feature. The printer skips to the next page when it reaches the bottom of the page. Since 4SpeedScript5 already controls paper feeding, you need to turn off this automatic skip-over-perf feature before running 4SpeedScript5, or paging won't work properly.

-1SPEEDSCRIPT 3.0 documentation page 10-0

To begin printing, simply press CTRL-P. 4SpeedScript5 prompts "Print: (device:Filename)>". You can print to almost any device, even disk or cassette. If you enter E: (for Editor), 4SpeedScript5 prints to the screen, letting you preview where lines and pages break. Enter P to print for most printers. If your printer is attached, powered on, and selected (online), 4SpeedScript5 begins printing immediately. To cancel printing, hold down the BREAK key until printing stops. You can use CTRL-1 to pause printing. Press CTRL-1 again to continue.

If you need to print to an RS-232 rpinter, just print to a disk file, then boot up your DOS master disk and use the copy selection to copy the print file to the R: device. You can also write BASIC programs to read and process a Printed disk file. Remember, a Print to disk is not the same as a Save to disk.

-1FORMATTING COMMANDS-0

The print formatting commands must be distinguished from normal text, so they appear on-screen in inverse video with the text and background colors switched. As mentioned above, the regular inverse video key is not used for entering inverse video text. Instead, hold down the SELECT key while typing a format key. All lettered printer commands should be entered in lowercase (unSHIFTed). During printing, 4SpeedScript5 treats these characters as printing commands.

There are two kinds of printing commands, which we'll call Stage 1 and Stage 2. Stage 1 commands usually control variables such as left margin and right margin. Most are followed by a number, with no space between the command and the number. Stage 1 commands are executed before a line is printed.

Stage 2 commands, like centering and underlining, are executed while the line is being printed. Usually Stage 1 commands must be on a line of their own, although you can group together several Stage 1 commands together on a line. Stage 2 commands are by nature embedded within a line of text. Again, remember to hold down SELECT to enter the formatting commands detailed here.

-1Stage 1 Commands-0

l Left margin. Follow with a number from 0 to 255. Use 0 for no margin. Defaults to 5.

r Right margin position, a number from 1 to 255 Defaults to 75. Be sure the right margin value is greater than the left margin value, or 4SpeedScript5 will go bonkers.

t Top margin. The position at which the first line of text is

-1SPEEDSCRIPT 3.0 documentation page 11-0

printed, relative to the top of the page. Defaults to 5. The header (if any) is always printed on the first line of the page, before the first line of text.

b Bottom margin. the line at which printing stops before continuing to the next page. Standard 8 1/2 x 11-inch paper has 66 lines. Bottom margin defaults to the 58th line. Don't make the bottom margin greater than the page length.

p Page length. Defaults to 66. If your printer does not print six lines per inch, multiply lines-per-inch by 11 to get the page length. European paper is usually longer then American paper--11 5/8 or 12 inches. Try a page length of 69 or 72.

s Spacing. Defaults to single spacing. Follow with a number from 1 to 255. Use 1 for single-spacing, 2 for double-spacing, 3 for triple-spacing.

@ Start numbering 4at5 page number given. Page numbering normally starts at 1.

? Disables printing until selected page number is reached. For example, a value of 3 would start printing the third page of your document. Normally, 4SpeedScript5 prints starting with the first page.

x Selects the page width, in columns (think 4 a cross5). Defaults to 80. You need to change this for the sake of the centering command if you are printing in double-width or condensed type, or are using a 40-column or wide-carriage printer.
n forced paging.

m Margin release. Disables the left margin for the next printed line. It's used for outdenting. Remember that this executes before the line is printed.

w Page wait. This command should be placed at the beginning of your document before any text. With page wait turned on, 4SpeedScript5 prompts you to "Insert next sheet, press RETURN" when each page is finished printing. Insert the next sheet, line it up with the printhead, then press RETURN to continue. Page wait is ignored during disk or screen output.

j Selects automatic linefeeds after carriage return. Like w, this command must be placed before any text. Don't use this command to achieve double-spacing, but only if all text prints on the same line.

i Inforamtion. This works like REM in BASIC. You follow the command with a line of text, up to 255 characters, ending in a return mark. This line will be ignored during printing, and is handy for amking notes to yourself such as the filename of the document.

h Header define and enable. The header must be a single line of

text (up to 254 characters) ending in a return-mark. The header prints on the first line of each page. You can include Stage 2 commands such as centering and page numbering in a header. You can use a header by itself without a footer. The header and footer should be defined at the top of your document, before any text. If you want to prevent the header from printing on the first page, put a return-mark by itself at the top of your document before the header definition.

f Footer define and enable. The footer must be a single line of text (up to 254 characters) ending in a return-mark. The footer prints two lines prior to the last line of each page. As with the header, you can include Stage 2 printing commands, and you don't need to set the header to use a footer.

g goto (link) the next file. Put this command as the last line in your document. Follow the command with the filename, including D: for disk. After the text in memory is printed, the link command loads the next file into memory. You can continue linking in successive files, but don't include a link in the last file. Before you start printing a linked file, make sure the first of the linked files is in memory. When printing is finished, the last file linked will be in memory.

-1Stage 2 Commands-0

These commands either precede a line of text, or are embedded within one.

c Centering. Put this at the beginning of a line you wish to center. This will center only one line ending in a return-mark. Repeat this command at the beginning of every line you want centered. Centering uses the page-width setting (see above) to properly center the line. To center a double-width line, either set the page width to 40 or pad out the rest of the line with an equal number of spaces. If you use double width, remember that the spaces preceding the centered text will be double-wide spaces.

When 4SpeedScript5 encpunters this command, it prints the current page number. You usually embed this within a header or footer.

u A simple form of underline. It works only on printers that recognize a CHR$(8) as a backspace and CHR$(95) as an underline

character. Underlining works on spaces, too. Use the first u to start underlining, and another one to turn off underlining.

-1FONTS AND STYLES-0

-1SPEEDSCRIPT 3.0 documentation page 13-0

Most dot-matrix printers are capable of more than just printing text at ten characters per inch. Some printers have several character sets, with italics and foreign language characters. Most can print in double width (40 characters per line), condensed (132 characters per line), and in either pica or elite. Other features include programmable characters, programmable tab stops, and graphics modes. Many word processors customize themselves to a particular printer, but 4SpeedScript5 lets you define your own Stage 2 printing commands.

You define a programmable 4printkey5 by choosing any character that is not already used for other printer commands. The entire uppercase alphabet is available for printkeys, and you can choose letters that are related to their function (like D for double width). You enter these commands like printer commands, by holding down SELECT as you type them. The printkeys are like variables in BASIC.

To define a printkey, just hold down SELECT while you type the key you want to assign as the printkey, then an equal sign (=), and finally the ASCII value to be substituted for the printkey during printing. Now whenever 4SpeedScript5 encounters the printkey embedded in the text, it prints the character with the ASCII value you previously defined.

For example, to define the + key as the letter z, you first look up the ASCII value of the letter z (in either your printer manual or any Atari manual). The ASCII value of the letter z is 122, so the definition is:

+=122

Now, anywhere you want to print the letter z, substitute the printkey:

Gad+ooks! The +oo is +any!

This would appear on paper as

Gadzooks! The zoo is zany!

More practically, here's how you could program italics on an Epson MX-80 compatible printer.

You switch on italics by sending an ESC (a character with an ASCII value of 27), then the character 4.You turn off italics by sending ESC 5. So define SHIFT-E as the escape code. Anywhere you want to print a word in italics, bracket it with printkey E then 4 and printkey E then 5:

The word 4Italics5 is in italics.

You can similarly define whatever codes your printer uses for features like double width or emphasized mode. For your convenience, four of the printkeys are predefined, though you can change them. The

-1SPEEDSCRIPT 3.0 documentation page 14-0

keys 1-4 are defined as 27,14,15, and 18, common values for most printers. On most printers, CHR$(27) is the ESCape key, CHR$(14) starts double-width, CHR$(15) either stopd double-width or starts condensed characters, and CHR$(18) usually cancels condensed characters.

4SpeedScript5 actually lets you embed any character within text, so you may prefer to put in the actual printer codes as part of your text. To set italics, you could just press ESC twice, then 4. The ESC key appears in text as a mutant E. Double width has a value of 14, the same value as CTRL-N. To start double-width, just embed a CTRL-N. Remember that you must press ESC before any CTRL key to get it to appear in text. CTRL keys appear as small "shadowed" capital letters. These characters, though, are counted as part of the length of a line, and excessive use within one line can result in a shorter than normal line. It can be more convenient to use printkeys, since if you ever change printers, you have to change only the definitions of the keys.

Keep one thing in mind about printkeys. 4SpeedScript5 always assumes it is printing to a rather dumb, featureless printer, the least common denominator. 4SpeedScript5 doesn't understand the intent of a printkey; it just sends out its value. So if you make one word within a line double-width, it may make the line overflow the specified right margin. There's no way for 4SpeedScript5 to include built-in font and typestyle codes without being customized for a particular printer, since no set of codes is universal to all printers.

-1HINTS AND TIPS-0

It may take you a while to fully master 4SpeedScript5, but as you do you'll discover many ways to use the editing and formatting commands. For example, there is a simple way to simulate tab stops, say for a columnar table,. Just type a period at every tab stop position. Erase the line with a CTRL-E, then restore it with CTRL-R multiple times. When you are filling in the table, just use word left/word right to jump quickly between the periods. Or you can use the programmable printkeys to embed your printer's own commands for setting and jumping to tab stops.

You don't have to change or define printer commands every time you write. Just save these definitions, and load this file each time you write. You can create many custom definition files and have them ready to use on a disk. You can create customized "fill in the blank" letters. Just type the letter, and everywhere you'll need no insert something, sustitute a unique character, such as an * or a CTRL character. When you're ready to customize the letter, use Find to

locate each symbol and insert the specific information. Instead of typing an oft-used word or phrase, susbtitute a unique character, then use CTRL-G to globally change those characters into the actual word or phrase. You can even use 4SpeedScript5 as a simple filing program. Just type in all your data, flagging each field with a unique character. you can use Find to quickly locate any field.

3269. ATARI 800 FOR SALE!!!

Newsgroup: comp.sys.atari.8bit
Date: 1990-08-29 17:18:39 UTC
From: bryces@mrloog.WR.TEK.COM
Message-ID: <3406@wrgate.WR.TEK.COM>
Source record: 114824
Cross-posted to: tek.forsale,pdx.forsale,or.forsale,misc.forsale.computers,comp.sys.atari.8bit

Atari 800 and peripherals forsale!!!
This unit is in excellent condition.

Package includes:

* Atari 800 CPU w/ 10K ROM
48K RAM (3x16K)

* ATARI 820 40 Column Printer

* ATARI 410 Program Cassette Recorder

* ATARI 810 Floppy Disk Drive

* (2) sets of paddles
(4) joysticks

Cartridges:

BASIC STAR RAIDERS
EDUCATION SYSTEM SUPER BREAKOUT
TOUCH TYPING COMPUTER CHESS

Lots of miscellaneous games including Oil Driller and Pro-Am Golf.

All this equipment comes in a custom built carrying case.

Price REDUCED to $250.00

From article <88937@srcsip.UUCP>, by cfleck@SRC.Honeywell.COM (Chuck Fleckentein):
> I would like to know if I can convert my 800XL to an 80 column
> machine. What hardware/software is needed ?
> Also, will this work with the old Atari communications package ?

Atari made (and it is still available most mail-order places) a
hardware device called the XEP80 which is box that takes the output
and sends it to a monitor. Some software was made that takes available
of it features, but not much.

As for a communication package, one that takes advantage of it is
BOBTERM. It has a module with it that you can load that allows
you to do the 80 column work via the XEP80, although you also need
your regular monitor/TV because the menu part, etc. is still sent
to there. I haven't seen it work but have heard good reports.

There are several ways to get 80 columns on your 800xl. Each way depends somewhat on what you want to do.
The easiest way is to buy the XEP80 module. The XEP80 works with BOBTERM (the best terminal program out right now), ATARIWRITER 80 (the wordprocessing program for the XEP80), SpartaDOS X (and any language cart that works with SDX), and, of course, AtariDOS 2.5. I'm not sure how well it works with other programs or cartridges - it will work fine with most well-behaved programs/carts, but most atari programs/carts are not well behaved. :)
The next way is with 80 columns done in software. There are one or two terminal programs (they stink) that use this. Very few programs work with software 80 columns, mainly because it requires so much memory (8k). I have a good monitor, and software 80 columns looks terrible on it.
I believe those are your only two choices. If you hear of any others, let the net know about them.

Have you tried 80 columns using reverse video? Displaying black
characters on a white background makes all the difference in
readability. I don't know if it makes a difference, but I use an
inexpensive B/W monitor (not a TV). I've been using a modified
version of VT52B.ACT with this configuration for a couple of years and
it makes a fine 2400 baud dumb terminal.

3273. Atari RS232 Interface info needed...

Newsgroup: comp.sys.atari.8bit

Hi, I'm working on an ST - 800XL 6502 cross development system and, for
code downloading and remote debugging I have come up with 2 alternatives:

1. Rig some hardware between the 800 and ST cartridge ports (you
can write to the ST port if you cheat.

2. Use RS232.

The RS232 idea seems to be the easiest so now I'm looking for info on the
RS232 interface (850?).

1. Can the 850 do 19200 baud?
2. Can it be programmed EASILY without using the OS (I *don't* know
how to use the SIO 'cos I never managed to get my hands on the
docs. Now, if someone could give me info on programming the SIO
I'd appreciate it!

Finally, for UK readers only, does anyone know how much 850s sell for
nowadays (new or second hand).

Thanks,
Dave.

PS. If 850 is the wrong part number, you'll understand!

What is the aesthetic difference between the XEP80 and software 80 columns?
My understanding is that the XEP80 uses the 320 X 192 graphics mode to emulate
an 80 X 24 text mode (just like the software method), so why wouldn't the two
80 column methods look identical?

Hello... can anyone help me? I have an 800 (48K) with an Indus GT disk drive.
I occasionally get disk errors (#140) when the motor of the drive turns on.
(For instance, my modem is 300 baud, which means that file transfer is slow
enough that the drive motor completely stops between writing one sector and
the next, so I'm almost guaranteed to get the error for one of the sectors,
which makes file transfers virtually impossible.) The error does not happen
once the drive starts spinning, so (for instance) copying files works fine.

The XEP80 uses at least an 8x8 matrix for each character. This means the
resolution is 8*80 or 640, not 320. That is the problem with the
software only 80 column emulators.
The 80 column emulators only use a 4x8 matrix for each character. Some
look good, but don't work with anything, others look terrible. :)

>
>-Dale

And for those others who took offense at me calling their favorite
80 column terminal program the pits, let me clarify - I was referring to
programs that include at least Xmodem and don't just simply act as
DUMB terminals. [Ascii capture is not sufficient to qualify as a non-dumb
terminal.]
As far as emulating a terminal type (VT100, VT52, whatever)
BOBTERM stinks, but for downloading, calling, macros, etc all the 80
column (software) term programs stink.

Words from the Editor

Happy Father's Day and welcome to the first issue of the Cleveland Free-Net Atari SIG's On-Line Newsletter. WE hope you enjoy it and will continue to bring you news, reviews, and articles every other month.

It may seem a little ironic that we would start a newsletter at probably one of the most depressing times in almost every Atarian's life but that is exactly why we started one. In this newsletter, we will not concentrate on what Atari is doing wrong but instead we would like to concentrate on what great things there are for your computer and how you can better use your Atari.

The Lynx is out and it is being advertised by Atari and just in time. It seems as if Nintendo, NEC, and Sega are all bringing out new portable game systems. Each of these new portable systems will be able to run games from their existing home system - something I'm sure Atari didn't think they would do. But Atari has a chance if they get in a lot of America's homes by this Christmas. The Stacy's hard disk drive problem is being fixed and already the Stacy is said to be the ultimate MIDI tool not to mention an ultimate Mac Portable! Rumor has it that the "Atari Advantage" package will be out by Fall in the U.S. and will consist of the STe (hopefully!) and a bundle of software to be sold in K-Mart type stores. A few rumors have it that a multi-million dollar advertising campaign to promote the STe and Stacy computers in the U.S. has indeed been signed. Of course, I cannot guarantee that all of this is true but is seems as though it is about time that rumors like these start becomming true. The last bit of hope that I can give you is

from Sam Tramiel himself. I received a letter from him about two weeks ago that said, "Please keep the faith strong in Atari" and "you won't be disappointed at year's end." I believe I won't.

Hmmm. What do we have for you in our very first issue? Everything. We formally introduce the Portfolio by giving you a review on it. A review for probably the most powerful product for the Atari 8-bits that brings you past MS-DOS is SpartaDOX X. SpartaDOS X as you will find out is why 8-bitters are still 8-bitters- it is probably the best kept secret. We bring you tons of reviews of software and products for the Atari ST. We bring you an article on what to do about Atari. What new titles are coming out from Sierra for the Atari ST. And much much much more!

Len Stys

What to do about Atari?

by

Kevin Steele

Recently, with the continuing slide of Atari's US market share, there have been a large number of angry voices crying out, demanding that Atari get its act together and release all those wonderful new machines it has been promising for the last two years. Many have threatened to sell their equipment and get Macs or clones if the new computers aren't out in this month or that month. For those of you bemoaning the current status of the ST market in the United States, I'd like to propose a little experiment:

1. First, sit down in front of your ST. Okay, are you seated?
2. Next, say these words directly at the monitor:
"Atari has abandoned the US market!"
3. Observe any reaction from your ST.

Did your machine stop working? Did it evaporate before your eyes? Did it run screaming from the room, spewing floppy disks? I thought not. Point is, odds are your ST neither knows nor cares what the current state of the U.S. ST market is--no matter what kind of strangeness goes on down in Sunnyvale, odds are your ST will continue to do what it has always done, unperturbed by rumors or vaporware, undaunted by the now-famous Atari 'revolving door' employee policy.

You have to ask yourself one very important question:

"Does my current computer meet my current computing needs?"

If it does, then there is no reason for you to panic every time a new computer is a couple of months or years late. Why be panic-stricken that the STe, Stacy, TT, or whatever is late when you really aren't going to buy one right away anyhow? I don't know about you, but my current system more than meets my needs, and I'm not going to start worrying about which computer to buy until such time as I see a genuine need to buy a new computer.

My ST system has more than enough muscle for my needs, and my needs are pretty big. As a freelance technical writer, I spend eight hours or more a day in front of my ST, churning out page after page of manuals, diagrams, invoices, and such. I've gotten nothing but positive remarks on the quality of the work I've created with my Atari ST, and as long as I can continue to produce professional-quality work in an expedient manner with this system, I see no reason to waste time worrying about what my next type of computer will be.

However, don't interpret any of the above as any sort of 'glossing-over' of the current status of Atari and their US policy -- my personal views of Atari's management style really aren't that positive. However, unlike many notable ST owners, I've made a conscious decision to stay out of the pulpit when it comes to the ever-popular "Atari-Bashing" sermon. If you've owned an ST for more than a month, you're bound to have heard it -- that endless diatribe on the evils underfoot in Sunnyvale, about the doom that each of us faces if Atari doesn't tow the line and submit to our wishes.

Why do I avoid "Atari-Bashing" when I share the same negative views? Well, think of it as a cost/benefit analysis: what will bashing cost me, and in what way will I (and others) benefit from it? In my opinion, bashing tends to simply make one look like a whiner, especially since it really doesn't yield any tangible benefits. If you're not a member of Atari Corp., you're powerless to instigate changes, and all of your angry Atari-Bashing screaming is just so much hot air in the wind. You'll save yourself (and others) an ulcer by avoiding this practice. Owning an Atari computer these days is discouraging enough with the scarcity of dealers and support--there's no need to add to the doom and gloom with endless tirades on the evils of Atari Corp.

The ST user community would be greatly enhanced if everyone who is currently spending their evenings "flaming" about Atari on local BBS's would instead upload a PD program, send in a shareware payment, participate in a user group, or spend a minute or two with another user who needs some help with their system. Take things in stride -- if your ST isn't affected by the current antics at Atari, then you shouldn't be either!

Kevin Steele

The Atari Portfolio (Review)

by

Tony Thomas

If you were to tell me a few years ago that there would be a full-function, 8088-based computer that you could hold in the palm of your hand, I wouldn't have believed it. Yet, I'm writing this article on just such a marvel of computer technology - the Atari Portfolio.

The Portfolio redefines the word "portable". When I bought my first portable computer - a CP/M-based Kaypro 2X - over five years ago, it weighed in at a hefty 25 pounds! Soon thereafter, I picked up another "portable" - a NEC 8201 (similar to Tandy Model 100) - which was a vast improvement, weighing in at about 5 pounds. The Portfolio, by contrast, tips the scales at just over a pound! In fact, I was even able to weigh it myself on a tiny Pelouze postal scale!!

Now, the obvious question is: Just how powerful is it? While the Portfolio won't do away with the desktop computer, it is the perfect portable supplement to it. Since it fits into a coat pocket and runs for more than fifty hours on a single set of batteries, the Portfolio is the perfect traveling companion that will be at home on a plane, in a hotel room or even at the beach.

Files can be transferred to and from the Portfolio to your desktop computer via the optional serial interface or to an IBM-PC or compatible via the optional Smart Parallel interface. Long term storage is also available via memory cards - an expensive medium (about $2-3 per Kilobyte) - limiting the Portfolio's usefulness as a stand-alone computer.

How compatible is the Portfolio with a PC? First of all, its internal memory is only 128K, making it only possible to run the most miniscule PC applications. Secondly, its operating system - DIP DOS - is similar to MS-DOS 2.11 in nearly every respect, except in the area of graphics. Since it does not permit direct screen calls and since the screen is only 40 characters by 8 lines), only simple programs that address the screen through DOS can be used. They mostly fall into the category of simple utilities.

The Portfolio, however, does contain some very useful application programs which replicate some of the more powerful mega-programs. The word processor is a simple ASCII editor with basic cursor movement and search and replace functions. It is adequate for routine tasks or for material that will be later edited and formatted on a desktop computer (though the Portfolio does offer some print formatting options allowing material to be printed directly from that machine). The spreadsheet emulates the basic functions of Lotus 1...2...3 Release 1A. Lotus spreadsheets (memory permitting) can be loaded into the Portfolio and vice-versa. The other applications (Address Book, Diary, Calculator) are similarly

straightforward and simple to use.

Is the Portfolio worth it? If you need desktop power in a tiny package, the answer is a resounding yes! While not as powerful as laptops like the Toshiba T1000, the Portfolio stands head and shoulders above PIMs (Pocket Information Managers like the Sharp Wizard and the Casio Boss) which are an electronic replacement to a Day Runner - address book/notepad/dairy. The Portfolio is a palmtop powerhouse that will enable you to untether the capabilities of your desktop computer and take it with you.

Tony Thomas

The "Atari Advantage" is a real advantage

by

Len Stys

In the beginning of this year, I wrote Sam Tramiel, President of Atari a letter. In this letter I stressed the fact that the "Power Pack" as it was then called was a great idea. The "Power Pack" now called the "Atari Advantage" was to consist of a 520STfm with a bundle of software to be sold at K-Mart type stores. What???! Put the precious Atari ST in K-Mart stores to make it a game computer? What about dealers? What about beig a serious business computer? How could I dare to even condone such a thing? Calm down and I will explain my reasoning.

Let's face it folks, Atari has no more than two dozen dealers in the U.S. and almost half of them rip us off because we have no one else to turn to. Need a TOS 1.4 chip installed? Sure, that will be $150 please. Or how about a 512k memory upgrade for your fm? That will be $250 please. I have never purchased hardware from my dealer that wasn't at retail price. The small number of Atari dealers may also explain why we don't see national commercials or magazine ads for the ST computer. Everyone is yelling, WHEN IS ATARI GOING TO ADVERTISE! What I would like to know is- how does Atari suppose to make any money when they advertise and their dealers only have a handful of computers on hand! They would not make enough money to pay back for the advertisements let alone make a profit. If Atari advertises in a city and there are one hundred people who want the computer and there is only one dealer with ten computers on hand, Atari will be losing out. They must have enough computers in a city to meet the demand when the advertisements create it. This brings up another question: why doesn't Atari just recruit more dealers? They have been trying but a lot of dealers would rather play it safe and stay with IBM and compatibles.

The big cry about the Atari Advantage package is that faithful dealers will get hurt by it. I do not see the logic in this whatsoever. I believe that Atari dealers will make out the best out of this deal. It is safe to say that these discount stores will not sell all the extras involving the ST line

of computers. Even if they do sell floppy drives, printers, and color monitors, they probably will not sell removable hard disks, hard drives, modems, laser printers, and monochrome monitors. As a new Atari Advantage user wants to expand his or her new system, they will go to Atari dealers to do it. So in this case, the Atari Advantage is really an advantage for dealers. Professional users who are into Desk Top Publishing or MIDI will no doubt go to Atari dealers for professional advise and help. This is where dealers will be able to sell the Mega ST professional computer system not to mention the Portfolio and hopefully new TT computer.

As for the ST becomming a serious business computer- you can forget it- or at least in large corporations. The new IBM and Macintosh computers have past the ST up in technology not to mention the new Amiga 3000. Why would a business purchase an Atari ST when they can buy faster and better computers from well known business computer companies? The TT will have to attack this market alone.

What about becomming a game computer? This is probably not a bad idea. Atari has equipped the new STe with 6 joystick ports, 4,096 colors, stereo sound, and better scrolling. I believe Atari will be trying to drive out the kiddies from Nintendo to the ST computers. Have you noticed? There are NO home/personal computers on the market? Remember what happened a few years ago? The video game market crashed and everyone who owned a video game system flocked to home computers. With the ST looking so attractive to children as a possible video game system and parents seeing the ST as taking their kids out of video games and into serious computers, Atari may have something hot here. The ST may be another C64 or even another Nintendo in the personal computer world but without competition for now.

The Atari Advantage package may be a way of getting some desperately needed users in the Atari world. With more users, there is more software, with more software, there is more users. I for one am willing to give up my ST as a professional system with only a few users to talk to in exchange for a personal/home system with thousands of users to talk to. I have seen user groups dwindle in size, I have seen Atari magazines go out of business, I have seen bulletin board systems close up due to lack of users, I have seen it all and I am getting tired of it. It is time Atari gets the ST out of its prototype stage and into America's homes.

The only thing that I was concerned about was the fact that the "Power Pack" was to introduce the 520STfm into the package. This would leave users with 512k even though most software being produced now requires 1 meg. This would actually put Atari back a step when they have the 1040STe ready to go. The STe would be perfect in the Atari Advantage package for it can be expanded easily in memory and has tons of nice features. I am glad to say that I am now hearing that the STe will be in the package instead and to me this was a great move by Atari.

The final question is when will this Atari Advantage be out? It should be out this Fall. The only thing holding it up is contracts with software manufacturers that Atari wants to include the STe with. Rumor has it that Atari has signed many major stores to carry the Atari Advantage already. A

rumor also has it that a multi-million dollar advertising campaign has also been given the OK for the STe, Megas, and Stacys. So you may want to consider saving up your money for this new package by Atari and get it for yourself, your children, or for me- it looks as if it will be a hit.

The Atari Advantage package should retail for around $400 and will include a disk drive, and tons of software.

Len Stys

Cleveland Free-Net with Z*Net

Several weeks ago, the Cleveland Free-Net became a proud official carrier of Z*Net Online Magazine as well as having an article about Free-Net published in Z*Net. Z*Net is one of the nation's best resources for recent news about Atari.

The SpartaDOS X cartridge
a review

by Doug Wokoun

The SpartaDOS X cartridge is the latest incantation of SpartaDOS for the 8-bit Atari and very possibly the most powerful Disk Operating System available for any 8-bit computer.

The SpartaDOS X cartridge consists of 64K of ROM, with 48K (or 6 cartridge banks) formatted into a ROM-disk, and the remaining 16K used as the main DOS core. The ROM-disk contains files and drivers used by the system and SpartaDOS X versions of several utilities found in the SpartaDOS ToolKit. It also contains a very versatile ARC utility package.

Some of the new features of SpartaDOS X (referred to as SDX):

o built in, memory resident FORMAT utility. Old versions of SpartaDOS could only initialize Atari format disks using 'AINIT'. To initialize a SpartaDOS disk required the loading of a program called 'XINIT'. Now, any time an XIO #254 call is made, the SDX format menu is brought up. With this, you can select a variety of disk densities and types. It will also allow "1-second" formatting by simply rewriting the root directory on a formatted disk.

o High speed disk I/O with U.S. Doubler, Atari XF551, and Indus GT disk drives.

o New file loader supporting relocatable files (certain disk based commands can be held in memory and later removed) and symbol linking.

o Probably the lowest MEMLO of any DOS. The DOS can load drivers under OS-RAM, into extended memory on an XE or at MEMLO on an 800.

o Environment variables: user definable PROMPTs, search PATHs, parameter passing on batch files, and a CARtridge or BASIC memory save capability will retain programs even if the machine is shut off.

o The ability to go from a cartridge to internal BASIC without rebooting. The CAR command enters the external cartridge, "BASIC" enters internal BASIC. You can go from Turbo BASIC XL to Atari BASIC to BASIC XE without rebooting! (with some provisions)

o Support of up to 1 Meg internal memory as a RAMDisk.

o "Persistent" batch files. Continued batch file processing even after loading binary programs.

o Fast, powerful, versatile ARC utilities. Supports ALF files. With these, you can Add files to an ARChive, Move (delete after Adding), Freshen (update files by date), Update (Freshen with Add capability), Delete files from an ARChive, View files in ARC, eXtract files, and Print ARC'd files to screen. The ARC utilities

also support password encryption and can function
with the screen off to increase speed. Also, all files are sorted
in alphabetical order when added to the ARChive.

o A new MENU program very similar to the MS-DOS XTREE.EXE program. This
program allows multi-file operations and displays the entire
directory tree, so files anywhere on a disk can be accessed easily.

o Command compatible with MS-DOS. Directory commands have several
aliases. CWD from disk based SpartaDOS can also be accessed
as CHDIR, or CD from SDX.

o Drives can be referred to by letter or number.

o Drives can be remapped. D1: can be SWAPped with D2:, etc. and from
that point on, any referrences to D1: will be sent to D2: and vice
versa.

SDX can be configured to take advantage of different hardware. A file
placed on D1: called CONFIG.SYS is used for this, or the default configuration
can be used. SDX can be configured to use OSRAM, or an extended bank of memory
for its drivers. With the right setup, MEMLO can be pushed to below memory
location $1000!

SDX uses a series of drivers to control most disk functions. SPARTA.SYS
is the main driver and must be installed. 'DEVICE SPARTA' is used in the
CONFIG.SYS file to do this. The number of sector buffers and file buffers
can be control by passing parameters to this driver. Another driver is
ATARIDOS.SYS used to read Atari DOS 2.x disks. Not installing this driver
saves memory, but then Atari DOS disks cannot be read. The SDX cart also
contains a RAMDisk driver which can be used to install up to 3 RAMDisks of
any size. An INDUS.SYS driver is used to program the INDUS GT to operate
at high speed. There are also two clock drivers, used depending on whether
or not you have an R-Time 8 cartridge.

A major change with the X cart is the way devices are addressed. Since
ICD wanted drives to be addressed by letter or number, conflicts would have
occured with existing devices. Also, ICD wanted SDX to be more similar to
MS-DOS, so those conventions were adopted. E: has become CON:, P: has become
PRN:, and D1: D2: and D3: are A: B: and C:. Switching between an IBM
machine and SpartaDOS X is much easier with these changes.

Another feature of SDX is its I/O redirection. With this, you can send
the output of a program to another device. Ex: DIR >>PRN: would do a
directory, but the results would be sent to the printer. Also, you can
use a file to "feed" a program with input redirection. Ex: BASIC <<file.ext
would call up internal BASIC and send it file.ext as if the contents of
that file were being typed into the machine. This would be used in place
of batch files because you can no longer send input to BASIC from a batch
file.

SDX recognizes two new file attributes in addition to protected, hidden
and archive. Hidden files do not appear in the directory, and archive is

used to mark files for backup. This is normally used with a hard disk backup program. When a file is updated, the archive bit is cleared, telling a program like Flashback that the file needs to be backed up. All of these are set with the ATR or ATTRIB commands (same thing). You can also scan directories for files with certain attributes.

Two new commands, PEEK and POKE make many operations easier. Instead of going to BASIC to execute these commands, they can be sent to the command line. PEEK will also display the value of the memory word stored at that location and the one following in hex and decimal.

Parameters can now be passed to batch files. In the batch file itself, these are referred to as %1 through %9. With this, you can create general purpose batch files to automate tasks.

Internally, SDX is very different from earlier versions of SpartaDOS. All of the files on the cartridge are relocatable and can be held in memory. COMMAND.COM, the command processor is one of these files. It is non-resident in nature and is unLOADed from memory when binary files are run. This saves about 4K of memory. It is reLOADed when the program is exited to DOS. Disk based programs written in relocatable format could be loaded at MEMLO, and held, eliminating the need to reload from disk each time. Unfortunately, information on how to write these modules is almost non-existant, so for now, only the programs on the cartridge can be held.

Some of the new commands and changes with SDX not mentioned above:

CHTD/CHVOL - now built in
COPY - now checks to see that there are two files specified. Files could be lost with disk based SpartaDOS by accidentally not specifying a second filename
DIR - /p directive pages output, /c directive gives file count.
DUMP - Hex dump of file
FIND - search all drives for filename
MEM - displays banks available, extended memory
PATH - Set search path
PROMPT - set system prompt with meta-strings
RS232 - now built in
SET - display/set environment variables
UNERASE - restore file(s)
X - load file/disable cartridge (for long binary files)

This is an incomplete listing of the features of SpartaDOS X. There are many others and new uses for the functions appear constantly. While learning to use SDX will take some time, it is well worth it in the end.

SDX is available direct from ICD. The ICD BBS contains a listing of ICD products available direct at prices much lower than through a store or even mail-order. Check for the latest price. ICD BBS: 815-968-2229.

Review & Hints

by

Robert Stys

In Police Quest II, you are Sonny Bonds, a promoted Police Officer from the first Police Quest to Homicide Officer. You are to capture or kill escaped criminal Jessie Bains. In the first Police Quest game, you put Jessie behind bars for his criminal activities and he is out to get anyone who had anything to do with sending him to jail.

I would first like to say that I enjoyed Police Quest II completely. I thought it was great and well worth the money I spent for it. It had great graphics and great sound. If you happen to have a musical keyboard, I would strongly advise you to hook it up to your ST and have the game play the music through the keyboard. And if you don't have a keyboard and play a lot of Sierra games, I suggest you get any kind that you can plug MIDI cables into from your ST into it. You will find hours and hours of enjoyment before finishing the game and when you do, you will say to yourself, this was a great game. If you like danger, romance, mystery, and excitement, Police Quest II is for you.

Is there anything that I didn't like about it? No, I can't say there is. Everything down to the Homicide Officer's Guide that comes with it is great. I wish however that Jim Walls, the designer of Police Quest would reconsider making a Police Quest III. He has just recently made Code Name: Iceman and it is suppose to be a big hit. He claims that he has run out of ideas but I can think of many. Perhaps he can try getting all the drug pushers off the streets or maybe gangs. I wouldn't even mind if some of the things he used in Police Quest I & II were repeated as long as they were in a different situation.

I have put together a list of hints for you in order to get through the game. In order not to spoil the game, I put them in the order of how you would need them.

1) Save your game often!

2) Try looking on the Captain's desk.

3) Try turning over the card that you have.

4) A bin is in the hall by counter that holds things.

5) Try going to the shooting range and adjusting your gun about 3 times during the entire game.

6) In the car, if the captain keeps calling you back, try getting in the car and type where you want to go before he starts calling you.

7) Be careful at Cotten Cove someone might be waiting for you...

8) Don't mind the stink, search it anyways!!!

9) Look at each tank and get the one that measures 2200lbs before diving.

10) Search the waters carefully for evidence.

11) Try looking in one of the toilets for a surprise! -not what you think.

12) Try drying the gun some how.

13) Remember- every officer even at an Inn may need backup sometimes, and if it helps, a search warrant wouldn't hurt!

14) Be careful when openning that door!!!

15) Have you looked in any jackets or under any turbans lately? It may just save a lot of people!

16) When all else fails, go to the bathroom! If that fails, go look for some towels! Only 70 seconds left, hurry!

17) Do the opposite of that of what you read.

18) Contact Keith when the mugger appears.

19) Look for the sewer hole, keep going even when you feel the gas is getting to you, then find the mask.

20) Tell your girlfriend to keep quiet for once!

If you need anymore help, send the Atari SIG a letter and I will be glad to help.

Alpha Systems Music Products
(Reviews)

by

Michael and George Polly

When it comes to making the ST into a sound digitizer one of the best programs out is Digisound ST Professional by Alpha Systems. In the package comes a digitizer which slides into the card slot, the main program and a play routines for your own programs. The digitizer has 2 inputs, one for a mic and the other for any normal audio signal. It has 2 knobs, one to control the input level and the other to adjust the level of the output. The program itself has many options and many ways to manipulate the sound. It supports full editing, fade in, fade out, reverse, echo, pitch change, volume change and many others. You can play a digitized sound or sample at various pitches by pressing different keys on the computer or by way of a MIDI connected keyboard. Digisound can sample at rates from 5000 to 40000 samples per second and store the sound on disk in Digisound, ST replay, or Hippo formats. For testing the input level, an oscilliscope is built in. I find it fun to just stare at it or see what your voice looks like in the mind of the computer. A real time echo can be applied to the input which is quite interesting. All of this is tied together in GEM windows for easy use. I have used Digisound for a long time now and I still find it fun and somewhat useful to use.

Beat Box, also by Alpha Systems, is a drum machine that uses sampled sounds from Digisound or other digitizing programs to make drum patterns and sequences. Beat Box can play 4 sampled sounds at the same time from a selection of 11. Making the pattern is as easy as pointing and clicking. Playback is through either any digitizer hardware or the ST monitor.

The final product of this series, Jam Master, turns your ST into a four voice polyphonic sampling keyboard. Jam Master allows a MIDI keyboard to play sounds sampled by Digisound. The included four track MIDI sequencer lets you play along with a previously recorded song. You can even define the keyboard to play up to 32 different sounds depending on the keys pressed. As with Beat Box, Jam Master works with ST-Replay and Hippo hardware and sound files.

What is happening in the Cleveland Atari World?

by

Mark Leair

Press Release - Pro! BBS News Returns - Press Release:
Back by popular demand! Pro! BBS News, an official online newsletter for Pro! SysOps and users is returning. Issue one of volume two should be available for download July 1,1990, and should be available on the support board (assuming it's up...) and The Basement BBS node x127 216-381-7859 3/12/24oo bps. Once again PBN will like to hear from users and SysOps of BBS Express Pro! BBSs, articles gladly accepted to be considered for publication. The newsletter will also run bi-monthly/6 times a year.

Atari S.I.G.'ware: All summer volunteer programmers are working on public domain programs for the Atari computer. The idea behind this project is simple. To spread the word on the great service the Cleveland Free-net has to accomodate for Atari Users and to hopefully add some more enjoyment to Atari computers. If you would like to volunteer to write a public domain program for this great project, contact Mark Leair via Free-net at aa338 or on The Basement BBS (telephone number above).
Lastly, if you don't program, but would like to help, contact Mark on details on how you can write a game with no programming knowledge or for other positions.

-Editor's Note:
You can also contact Mark through the Atari SIG's address in the beginning of this newsletter.
-

TCP BBS II: Just as a lot of Atari boards are going down, TCP is being enhanced to a new and better version. Call the old TCP BBS for more information at 216/228-7335.

Time Zone: Time Zone is a new Cleveland BBS that seems like it will stick around for awhile. The SysOp has also just added an 8-bit section to the board so Atari 8-bitters won't feel left out. The number for Time Zone is 216/786-1701 at 300/1200/2400bps.

Free-Net Registration Fee Waiver and Free Membership!

Now for a limited time only! You may sign up for an account with the Cleveland Free-Net for absolutely no charge. And if you hurry, you may be one of our lucky users to get a free membership account. This means no timely fee for use of the system. To show the Cleveland Free-Net Administration how big the Atari community is, please include that you are an Atari computer user. Thanks!

---------- Start of first page

INSTRUCTIONS

Thank you for downloading this registration infor-
mation for the Cleveland Free-Net--a free, open-access,
community computer system brought to you by Case Western
Reserve University School of Medicine, in conjunction with
the Information Systems Division of AT&T and University

Hospitals of Cleveland.

The registration process is very simple. Below you will find three forms. The first of these is an agreement--the terms, if you will, of your participation on the system. This form MUST be signed and dated. The second is the registration form which provides us with, among other things, the information necessary to set up your "account" on the system and to enter you into the user directory. The third form is an optional one, but one we think is very important. It provides us with the basic information necessary to study the system and its utilization.

To register, simply fill out these forms and mail ALL THREE of them to:

The Cleveland Free-Net Project
c/o Community Telecomputing Laboratory
Wickenden 319
Case Western Reserve University
Cleveland, Ohio 44106

There is NO CHARGE for this registration process and NO CHARGE to utilize the system.

We will send you your ID number, a temporary password and a brief Users Guide as soon as possible. In the meantime, feel free to use the Free-Net as a visitor. The number is (216) 368-3888 (300/1200/2400 baud).

Thank you.

T.M. Grundner, Ed.D
System Administrator

AGREEMENT

In exchange for the use of the Cleveland Free-Net Computer System, I understand and agree to the following:

1. That the use of the Cleveland Free-Net is a privilege which may be revoked by the administrators of that system at any time for abusive conduct. Such conduct would include, but not be limited to, the placing of unlawful information on the system, and the use of obscene, abusive or otherwise objectionable language in either public or, upon registration of complaint, private messages. The staff of the Cleveland Free-Net will be the sole arbiter of what constitutes obscene, abusive, or objectionable language.

2. That the Cleveland Free-Net reserves the right to review any material stored in files or programs to which all users

have access and will edit or remove any material which the Cleveland Free-Net, in its sole discretion, believes may be unlawful, obscene, abusive, or otherwise objectionable.

3. That all information contained on the Cleveland Free-Net is placed there for general informational and entertainment purposes and is, in no way, intended to refer or be applicable to any specific person, case, or situation.

4. That the Cleveland Free-Net does NOT warrant that the functions of this system will meet any specific requirement you may have; nor that it will be error free or uninterrupted; nor shall it be liable for any indirect, incidental or consequential damages (including lost data, information or profits) sustained or incurred in connection with the use, operation, or inability to use the system.

5. To abide by such rules and regulations of system usage as may be promulgated from time to time by the administrators of the Cleveland Free-Net.

6. In consideration for the privilege of using the Cleveland Free-Net and in consideration for having access to the information contained on it, I hereby release the Cleveland Free-Net, its operators, and any institution with which they are affiliated for any and all claims of any nature arising from my use of the Free-Net.

OPTIONAL PERSONAL INFORMATION

The Cleveland Free-Net is essentially an experimental system. It is a significant "first" in the field of computing and, because of that, we believe it will be the source of a great deal of study in the years to come.

To help facilitate our ability to learn more about this system and how it is used, we are asking that all registered users complete a brief questionnaire about themselves. This information will be kept completely confidential. At no time will it be made available in a form that is linked to your name, nor will it be made available to anyone for commercial purposes.

Answering these questions is optional. You will still be a fully registered user of the system if you do not fill them out. However, because of the unique nature of the system and the unusual opportunity we have here in Cleveland to study it properly from the beginning, we would like to urge you to help us out by completing these items.

Please fill in or check off the following:

1. What is your age? _____

2. What is your sex? _____ 1. Male
_____ 2. Female

3. What is your race?
_____ 1. White
_____ 2. Black
_____ 3. Asian
_____ 4. Hispanic
_____ 5. Other (Please specify _____

3. What is your educational background?
_____ 1. Completed a graduate degree
_____ 2. Completed a 4 year college degree
_____ 3. Completed at least one year of college
_____ 4. Completed high school
_____ 5. Completed the 10th or 11th grades
_____ 6. Completed the 7th, 8th or 9th grades
_____ 7. Completed less than the 7th grade

4. What is your occupation? (Please PRINT)

_____

5. What is your total approximate household income?

_____

THANK YOU FOR YOUR HELP!

New Games from Sierra for the Atari ST
(Reprinted from Sierra News Magazine Vol.3, No.1)

Three New Products for ST Coming Soon!

At a time when many publishers are discontinuing or cutting back development on computers other than MS-DOS and Macintosh, Sierra On-Line is moving outside of these large markets to increase; development for the Atari ST, both in the U.S. and in Europe.

In the first quarter of 1990, Sierra has plans to ship no fewer than three new Sierra titles, with two of these planned between April and July. Due out soon are new Hero's Quest, Leisure Suit Larry 3, and The Colonel's Bequest. Later in the year, Conquests of Camelot and Codename: Iceman will be released for the ST in the U.S. and European markets (the ST is a particularly strong contender in Europe, especially in Germany).

According to Sierra Marketing Analyst Tony Caudill, "Although the Atari ST continues to be the smallest software market Sierra sells to, we are still looking for continued growth. In the U.S. the rolleplaying game cateogry, which is the cornerstone of Sierra's Atari ST business, is one of the few gaming categories that saw actual growth in the last 12 months. With our imminent release of German language versions of our most popular adventure games, we see great promise in our international ST business in the next year as well."

-
Editor's Note:

I have contacted Sierra and they tell me that most of these games should be out by the end of this month. I also heard that Space Quest IV is on its way!!!! For the ST, look at the beginning of next year.

I would also like to remind you of ONE VERY IMPORTANT THING... remember to send back your warranty registration card. This tells Sierra how many ST software titles have exactly been sold. The more of these they receive back, the more faster you will see new titles for the ST.
-

Lynx and new Lynx game cards

The Lynx is the only color portable video game system available. It has 4,096 colors, a 16-bit chip, 4 channel sound, super zoom and scrolling. The most fascinating thing about the Lynx is that you can connect up to 8 other Lynxs together to play real great games with each a different perspective. Other portable systems are in the works to challenge the Lynx but they probably won't be here until next year and with a higher price tag.

The Lynx has a retail price of $179.95 but can be purchased for cheaper. What a Christmas gift!

What good is a portable? The next time you are in a traffic jam, the next time you are waiting for your wife to get done shopping, the next time you have to wait for something with nothing to do, think to yourself that you could have had a Lynx.

Title available for the Lynx now are:

California Games, Blue Lightning, Electrocop, Gates of Zendocon, Chip's Challenge, & Gauntlet- The Third Encounter

New game cards coming by this Christmas include:

Flying Ace, 720, Paperboy, A.P.B, Rygar, Football, 3D Barrage, Road Blaster, Super Soccer, Checkered Flag, Tournament Cyberball, Zarlor Mercenary, Xenophobe, Klax, Rampage, Vindicators, Ninja Gaiden, Slime World, Turbo-Sub, Junkyard Dog, Ms. Pacman, and many more...

Up to 25 new game titles will be available by the end of the year.

Rampage - You're a huge monster trashing 175 different cities. The army will try to stop you, so eat as many soldiers and tanks as you can. Burp.

Klax - The latest arcade hit from Atari Games. You must form "Klax" from colored tiles tumbling down the conveyor belt. 100 levels.

Chip's Challenge - Help Chip through 144 challenging levels without getting nailed by cherry bombs, water traps, and literally hundreds of other hazards.

Gates of Zendocon - the hideous spider Zendocon has sent you deep into its web of 51 deadly universes. Survive each universe if you hope to return home.

Vindicators - 2 player version of the Atari Games Arcade hit. Drive your tank through alien stations to find and destroy main control areas.

Blue Lightning - You're flying the top secret Blue Lightning combat jet. But you have to survive missiles, ice fields, canyon walls and the dark of night.

Zarlor Mercenary - Fight your way through multi-layered 3-D landscapes. Fight well, and you will be rewarded with better armor and weapons.

Guantlet - The enchanted Star Gem has crashed to earth. Capture it from evil creatures before they use its magical strength to destroy man. 1 to 4 players.

Xenophobe - Four player version of the arcade hit. Aliens have infested the space stations. You lead an ill-equipped group of Astronauts to abolish the Alien Menace.

About the Cleveland Free-Net Atari SIG

The Atari SIG is a Special Interest Group servicing all Atari computer users. In the Atari SIG, there are many different sections which you may use.

One of the first sections that you may use is the User Group Information listing. Here you will be able to access information pertaining to the Atari user group meetings for the Cleveland area. It will contain the time, location, and date of the meetings.

The Atari News section is the place to go for all of the latest news being released that is related to Atari.

The General Bulletin Board is the place for Atari computer users to meet and discuss any problems, suggestions, or experiences that they might have.

The Specific Computer Boards option leads to several bulletin boards of different computer types. It doesn't matter what Atari computer you have, the Cleveland Free-Net Atari SIG supports it.

The Programmers' Forum is a section of the Atari SIG dedicated to all of the Atari programmers. This is where programmers can discuss with other programmers about any problems or solutions that they might have dealing with programming.

The Wanted & For Sale Board is the market place for Atari users. This is where users may post messages to sell their equipment or just let others know what they are looking to buy.

Another section which you may select is the Software/Product Information section. This part of the Atari SIG contains information on all of the software and products available for the Atari computers. This section includes reviews, summaries, and discounts on various

software and products.

The Atari Library section is a place where you can get old Atari SIG information, On-Line Magazines, and User Group Newsletters. You may also find various documents in the Information Base.

The Help-Line is the place to ask specific technical questions about your Atari computer. The SIGOps manning the Help-Line are ready, willing and able to help. Your question will be answered as soon as possible.

And finally there is a directory of all the Atari SIG members. This section is a database of all the Atari SIG members.

If you have any articles, reviews, product releases, or news that you wish to contribute to this newsletter, you are welcome to send them to us. We cannot guarantee that your contribution will be published in the next newsletter but probably will be. If you wish to send us a letter, or your contribution, you can send it to us by our U.S. mail address, Internet address, Bitnet address, or Free-Net address that can be found in the beginning of this newsletter. You will receive full credit for any contribution published.

SysOps of the Atari SIG are: Phillip M. Chow, Jim Haynes, Mark Leair,
_____ Scotty Meredith, Len Stys, Doug Wokoun,
Cleveland Free-Net Atari SIG| and honorary SysOp Kevin Steele.
Newsletter (c) 1990 |

The Cleveland Free-Net Atari SIG Newsletter is a bi-monthly released publication covering the Cleveland Atari Community as well as nationally. Opinions and commentary included in this newsletter are that of the authors and do not reflect those of the Cleveland Free-Net Atari SIG in any way. The Cleveland Free-Net Atari SIG Newsletter is copyright 1990 by the Cleveland Free-Net Atari SIG. Words from the Editor

As you may have heard, the Atari SIG was going to and did have a Mini-Expo. Was it a success? What happened at the Mini-Expo? What would we do that we didn't do this year if we have another expo next year? All of these questions will be answered in a special Atari SIG Mini-Expo report in this newsletter.

Also in this newsletter is going to be some information on why Atari shouldn't get frustrated yet over the upcoming depression that experts say we are headed for. We will have information on the new Atari STe and how there might actually be two versions of the same machine out in the U.S. - one that works and one that might be full of bugs- both being sold to you. We will give you information on some new things going on with Free-Net and how we can take advantage of Free-Net Version 2.2. A way to get around the lack of a file transfer section on the Atari SIG? It seems as if we have figured a way and two Atari SIGOps are organizing it. The Computers for Children of War campaign is taking off and we will have more information on that. A time, date, and channel to converse in multi-user chat for Atari users! Yes, multi-user chat is in place and we are taking advantage of it!

We also have some reviews such as the one about SEX (not what you think) by Scotty Meredith. Also a reprint of a few articles by Kevin Steele from NOAH Newsnotes. Kevin is not only the editor of NOAH Newsnotes but he is also the Atari SIG's new SIGOp on Free-Net. As a writer and desk top publisher who needs a computer that can crank out diagrams and charts that look professional he has a lot of experience using the ST for professional use. He should be pretty helpful to anyone that has any questions on how powerful

the ST is in a business.

The Atari SIG users listed in the user directory on the SIG will be receiving a special version of this newsletter concerning some recent information released from Atari concerning Cleveland. And again- this newsletter promises to be yet another informative issue for Cleveland and U.S. Atari users.

Len Stys

****

The Atari SIG Mini-Expo
By Len Stys

The Atari SIG Mini-Expo is now over and it was an expo that was very unique. Unlike other expos, the Atari SIG Mini-Expo didn't go to a motel or gymnasium and invite the public to come special for it, the expo went to where the public was going to be already. It was held during the Slavic Village Harvest Festival that was suppose to attract 100,000 people. Unfortunately, it rained a bit that weekend which not only drove a good number of people away but also Atari users as well. The main idea behind the expo was to get Atari users in the Greater Cleveland community together while also showing off some very nice Atari computing and Lynx equipment to the public who weren't aware of what Atari's could do outside the 2600. The Mini-Expo was publicized by Atari User Group newsletters (NOAH specifically), flyers, Z*Net Online Magazine, and surprisingly a subscribed Atari user group newsletter called NEO-STAG. All of these things promised great user attendance but many thought that the rain cancelled the festival thus cancelling the expo. The festival however wasn't cancelled and neither was the Mini-Expo. It did not even rain in the area of the festival as much as it did throughout the rest of the city. The expo was also located inside of a store so even even if it did rain bad, we wouldn't be effected by it.

What went on at the Mini-Expo? We got to finally Lynx-Up with other Lynx owners which was pretty incredible and in my opinion - the Lynx is ahead of its time- way ahead. I believe even with NEC's Turbo Express around the corner, it still won't beat the Lynx in linking up with other systems. By the way, a good number of kids came down and played and played with the Lynx vowing that they would get one or ask for one from Santa. There were also ST and XE computers set up by myself, Scotty Meredith, Doug Wokoun, and John Dernar. There were two STes at the expo supplied by Len Olenik from a company called, "TGIA Computers" which stands for Thank Goodness It's an Atari! I think that title says it all. Len sold software and products at about 30% off or better than retail. He claims that he will match any price of any mail order so as long it isn't ridiculous. He also sold European magazines for only $9 with disk! Monitor stand power surge protectors for only $20! And special Mini-Expo deals on software at the cost of only $10 each! Len said that he will continue the 30% discount or better on software and special deals on hardware for Atari SIG users only. So if you are on the SIG's directory then I think you are about to save some

money... His number is in the area code 216 but is still long distance
so you must first dial a 1 then 336-2215 when calling. Please note
that you should still support your local dealers but if you were going to
buy mail order anyways, you may want to give him a call... He was the only
vendor that cared to show up for the expo and we didn't charge him a vending
fee.

Overall, the Mini-Expo was a success. We showed people who came
in the store what Atari's can do and they were glad they came by. The
people that didn't make it are now hearing that it was pretty good and
wish they came. Hundreds upon hundreds of people walked past the store front
and looked through the window and read the signs stating ATARI COMPUTER
DEMONSTRATIONS but did not come in. But by us being there and those signs
being there, we made aware these people that Atari sells computers!
We also had some pretty big poster signs (thanks to Mark Leair's sister,
Sue) on top of the store stating Atari POWER Computing Demonstrations
that could be seen down the street by thousands... The only real misfortune
that we had was unexpected and that was several tents placed in front of the
store in which the expo was in. These tents belonged to the street vendors of
the festival and had never been placed there in the 12 years of the festival
before. This blocked most of the store from view and many people weren't even
aware that we were there. But overall, we had fun and the Atari users that did
show up didn't leave disappointed. And the Atari vendor that showed up assured me that it
was worth his time and effort and that the other dealers
didn't know what they were missing- especially future customers.

Will we do it again next year? You bet if the store is still vacant
and if no one thinks of a better idea. We will also take care of some problems
that we had this year. We will make sure that there is no obstruction in
the way of the store front. We will have speakers on top of the store
window playing the STe's stereo sound and perhaps even pass out some helium
Atari balloons...

****

What people thought of the first Atari SIG Newsletter

-Message #6 (47 is last):

-From: af611@cleveland.Freenet.Edu (Anthony V. Fernando)
-Subject: Re: Atari SIG Newsletter Vol.I No.1
-To: xx004@cleveland.Freenet.Edu

When I first joined Free-Net, I ran an Atari 800 personal
computer with 48k. About a year ago I got an 130XE.

I'm supprised that Atari has begun to give up support of the
Atari ST line. The ST quickly phased out the 8-bit Atari's.
In short, I'm glad the Sig still exists.

Thank you for the newsletter. I'm very strong into using the
Atari for all my needs. In fact the school where I teach will be
converting to the ST during the school year 1991 - 92. I've had
an ST in my room, social studies, for three years now and other
teachers began to realize the power of the ST. The computer
teacher was so amazed that he began the process of converting. It
took a lot of convincing to get the administration to approve the
switch from Apples to Atari's. As of this year there are six ST's
in our school and by the end of the upcoming year there will be
about 15. Maybe sometime you might be able to start an
educational column. If so, maybe I can be of help. I do have
some educational software that I use in class. I'm always
looking for more. Once again, thanks.....

I still own the ST and use it just about every day. I can see that you have
done some homework and recruited a number of good people to help with this
SIG. If you need any other help, just let me know.

Blood, Sweat, and Smears
(or: How I Got Started in Atari DTP)

Copyright 1990, by Kevin Steele.
All Rights Reserved.
(Reprinted from NOAH Newsnotes by author)

Okay, so I finally did it--I quit my job and went Freelance
on a full-time basis. This step was similar to stepping out
of a 17th-story window on the assumption that someone below
will just happen to have a safety net in their pocket, ready and
eager to save your stupid skin. My previous jobs, namely thati]
of Documentation Specialist and Technical Editor, had already
introduced me to the wonderful world of publishing, and all
of the erratic rules thereof. I was prepared for any
potential publishing problem thrown my way, my head swelling
with terms like 'pica,' 'keyline,' 'repro,' and 'kerning.'

What I was not prepared for were things like project
proposals, quarterly estimated taxes, and devious little

things called 'penalty clauses' hidden deep within contracts. Well, to make things short, I managed to live through the experience, but after the smoke cleared, the problem still remained of how to equip my new 'Home Office' (actually, the second bedroom in my apartment) with all the necessary high-tech goodies and still somehow manage to eat on a semi-regular basis.

Step one was buying a computer. I was once given some very good advice on buying a computer: first, figure out what it is you want to do with a computer, then find the software that will let you do what it is you want to do, then find the computer that runs the software that lets you do what you want to do. Quite a mouthful, but good advice nonetheless. When the time came to equip my home office with a computer, I took that maxim to heart. As a writer, I wanted a 'friendly' computer to primarily use for writing and desktop publishing--so I wanted a Macintosh, right?

Wrong. My specialty is technical writing, and I had been trained on Ventura Publisher, which is a wonderful system for long documents. Okay, then, should I buy an IBM? I couldn't bring myself to buy one--I hated to have to give up all those wonderful Mac programs that have made it the top contender in the desktop publishing market. Should I buy both? This was completely out of the question, as I was on a very, very tight budget, and couldn't even afford to buy a basic Mac system, let alone both a Mac and an IBM computer. My solution? I bought an Atari Mega ST.

To someone unfamiliar with the Atari ST, this step would have seemed like buying a Yugo because you couldn't decide between a Ferrari or a Porsche. Luckily, I knew better. Like the Volkswagen GTI, the ST packs a lot of power under an unassuming front. I bought the ST primarily because of the emulators available, as I had serious plans on using IBM and Macintosh software for business, and maybe, just maybe, using the computer in standard ST mode to play a few games. As of this date, I have yet to use an emulator for any serious business application.

The reason I have sorely neglected my emulators is that the ST has met all of my writing and desktop publishing needs, and at a very reasonable cost. Sure, I could have gone out and bought Ventura Publisher, but why bother when an ST program like PageStream or Calamus meets my needs for $500-900 less? Like a bargain-hunter gone mad, I have found myself drawn again and again back to ST software over equivalent Mac and IBM software. The best part is, that quite often the ST version of a software package has features superior to the corresponding IBM or Mac version.

For instance, take WordPerfect on the ST. It includes such 'revolutionary' features as drop-down menus, mouse control, and re-sizable windows. The latest version of WordPerfect on the IBM, namely 5.1, has just now added mouse-controlled menus, and it still doesn't offer the same versatility with windows as the ST version. Another desktop publishing package that has superior features to the corresponding IBM or Mac counterpart is PageStream. With PageStream, you can rotate text and graphics, work on up to six documents at the same time, and produce color separations with crop marks. You can do none of these with PageMaker. With impressive ST packages such as these, I have had no need to buy the pricier, less-powerful IBM or Mac equivalent.

Since starting my writing career, my ST has been used to write manuals, articles, and stories; produce technical diagrams, maintain client lists, and track overdue invoices; and kill a few Dungeon Master baddies now and then (hey, all work and no play...). In all of these endeavors, I have managed to gain a detailed, nay, an intimate relationship with my software packages, and all of their associated bugs. Normally, a bug is nothing more than a minor annoyance. However, when your livelihood depends on your computer, each bug somehow suddenly manages to become a deep personal crisis. There's nothing like seeing two hours of work go 'poof!' the night before a project is due to help speed up the balding process, let me tell you from personal experience.

Well, I hope that this article has helped to provide you with the 'big picture' on my background, and how I got started in the fun-filled world of Atari DTP. I've managed to make a living as a freelance writer with my Atari computer now for almost two years, and I see no reason that my ST and I can't continue working together for years to come. In the final analysis, the true acid test of a business computer is whether or not it can produce the kind of professional-caliber results that you require. The ST may not be considered a serious 'business computer' by most, but don't tell that to my Mega!

****

What computer packages are being sold in Europe?

***** 520 STfm Discovery Package *****

High quality, good value package based around the 520STfm computer including 512k RAM, 1MB Drive and built-in TV modulator. Also supplied is

STOS Game Creator
Carrier Command
Space Harrier

First BASIC
Outrun
Bomb Jack
Neochrome
Atari ST Tour
plus "Discovering your Atari ST" book

All for around $450 American money

******* 520STe Power Pack *******

Includes the latest 520STe with 1MB drive, joystick, mouse, user guide, 5 disks of public domain software, plus an incredible selection of chart-topping software (value of around $800 American money). Sofware List includes:

R-Type
Afterburner
Double Dragon
Super Hangon
Space Harrier
Overlander
Pacmania
Starglider
Super Huey
Eliminator
Predator
Bombjack
outrun
Bombuzal
Xenon
Guantlet II
Black Lamp
Starray
Nebulus
Stargoose
First Music
First Basic
Organiser

All for around $550 American money

**** 1040STe Professional Package ****

Superb starter package consisting of a 1040STe with an excellent selection of starter software. Pack includes:

Kuma Wordprocessor
Kuma Database
Kuma Spreadsheet
Kuma Business Graphics
First BASIC
Hyper Paint
'Prince' game

STAC Adventure Creater

All for around $750 American money

-
These seem pretty good but Atari isn't the only one selling packages.
Here's a few from its rival- Commodore:

***** Flight of Fantasy - Amiga *****

Includes 512k RAM, 1MB disk drive, mouse, T.V. modulator, workbench software, Basic Language disk, F29 Retaliator, Rainbow Islands, Escape From The Planet Of The Robot Monsters.

All for around $700 American money

****** Batman Pack - Amiga ******

Includes 512k RAM, 1 Mb Disk Drive, mouse, T.V. Modulator, Workbench software, Basic Language disk, Deluxe Paint II, Batman the Movie, New Zealand Story, Interceptor.

All for around $700 American money

****

Cleveland Free-Net Atari SIG Related News

___Atari Conferencing using Multi-User Chat!___
_____

The Atari SIG users will be chatting online every Sunday at 8:00PM
on channel 1040.

The multi-user chat has just been implemented on Free-Net and we are
going to take advantage of it! Be there!

___Atari SIG founder retires as SIGOp___
_____

Jim Haynes, one of the first original Atarians and founder of the
Atari SIG on Free-Net will no longer be a SIGOp for the Atari SIG. However,
you will still see him around the Atari community and hopefully the Atari SIG.
Thanks goes out to him especially for getting the ball rolling.

___File Transfer? On Free-Net?___
_____

As you know, the Cleveland Free-Net does not have upload/download
sections for computer users but individual file transfer has just
been implemented.

Scotty Meredith is working on an ST P.D. file list for Atari SIG users.
Doug Wokoun is working on an 8-bit P.D. file list for Atari SIG users.
If you see a file you want on the list, you would make a request for it to them
and they will send it to you through file-mail. Also, if you have a file
that you don't see on the list then you would send it to them through file-mail

for them to place on the list and give to other users who may want it.

When asked when they would complete their list, Scotty and Doug
both stated that Free-Net will first have to increase the time the file
stays in a person's account. It is presently at 1 day before deletion
and that is really just too short. It needs to be there for at least several
days.

___New Free-Net version goes on-line!___
_____

1) Multi-User Chat
NOTE: Due to the nature of multi-user communication
(ie. lots of people typing at the same time) this
program requires the use of a "smart" terminal.
(for example vt52, vt100 or ANSI)

2) Kermit and Xmodem will be made available to everyone.
This will allow you to upload and download files to
your private work areas and transfer files among
yourselves. Because there is a limited amount of
disk space available there will be a limit on the
size and number of files you can put in your work
area. Also the files in your work area will be
deleted after 24 hours. Due to security issues that
we are not prepared to deal with, we will NOT provide
a "public" area for the uploading/downloading of
files at this time.

3) The ability to have your mail sent to another address.
For those of you that have accounts on another system
on Campus or on the Internet, you can have your Freenet
mail sent to you there.

4) The ability to create private mailing lists.
You will be able to create your own list of mail aliases
so that you can mail to groups of people easily.

5) Minor additions to the news reader:
o Search and backwards scrolling within news articles.
o Marking articles as unread.

6) Improved Help files.

7) Database feature

8) SIG Directories installed

Synchro Express
Review by Scotty Meredith
(C) 1990

I have owned an Atari ST for several years now. When the ST
first came out, I heard how powerful it was. This machine can do
it all! I saw the graphics, sound and all the other features that
the original eight bit system could not match. After getting the
system home, Unpacking it, and putting it all together, I was
ready to "Unleash the power" of this fantastic machine. After
buying some software to take advantage of the features, I ran in
to a problem. There was no real disk copier that would back up
these valued gems. How could this be??!! The eight bit line has
a happy drive to copy ANY disk, and this new machine with all it's
power does not? "It will only be a matter of time" I said to
myself. "Surely with all that memory and power they will have
something"! Finally, a program called ProCopy came along.
ProCopy was fine, but with new software titles came new
protection, witch lead to new ProCopy's. Soon there were a dozen
versions of ProCopy. Another problem was, when you bought an older
title (Don't laugh, I just bought Infocomm's The Witness last
week!!) you would have to try each version of ProCopy until you
found which version copied it. Contrary to popular belief, the
latest version of ProCopy will not copy every title that older
versions would. Micro League Baseball is another problem. I am
not giving a course on how to pirate software, but Micro League

Sport's Association has a really good method of copy protection. Before you ask, YES, I OWN THE ORIGINAL! I still have not sent my warranty card in..... But I do have a store-bought original. If you copy the disk, and load the copy, it works! or does it? Sometimes you can make it through a complete game with no problems, other times (95% of the time) you are'nt as lucky. Mid-way through the game, the scoreboard will say "WXYZZZ DOES NOT WORK!" and the players will run out of the stadium, out in to left field. It is disappointing to be throwing a no-hitter in the bottom of the ninth, and never know what would have happened.

Then a friend introduced me to SEX. No, not the kind that teenage girls are discovering at a younger age, but SEX on the computer. How can you have Sex on a computer? The average male weighs 200 lbs. and the average female 120. That is 320 lbs!! Can the ST support all that weight??!! The fact is, I have had SEX on my computer for a couple of month's now, and it has never ran better! Even a backup copy of Micro League Baseball works! Ok, before I get the parent's of America sending me nasty letters, let me explain. SEX is short for Synchro EXpress. A new disk copier from Coast to Coast Technologies. The package comes with a disk, and a over-sized printer connector with a disk drive socket and a tail with a disk drive plug on it. I have heard of a similar device called the BLITZ cable, that you can make yourself. I cant bring myself around to believe that a disk copier that claims to copy it all, would be free (except for parts). I have had bad dreams about BLITZ, actually being a hardware virus. THIS IS NOT A FACT OR AN OPINION, IT IS ONLY A DREAM. I am not saying it is or is not, I just cant figure out, why someone would develop a product as wonderful as this, and release it for free. Getting back to SEX (sorry), Synchro Express. This is the disk copier I have been waiting for. I have only ran across one program that it would not back up. That being GUNSHIP. I don't know why, but I could not copy it. I even tried twice. but it DID copy dozens of other programs. The real advantage to SEX, is it does it FAST! A single sided disk is copied in 22 seconds. A double sided in 44. The destination disk does not even have to be formatted! I have two Indus disk drive's on my system, and it was something to see both track indicator meters displaying the same number all the way through the entire copy. As i Said, Synchro Express plugs in to both the printer and disk drive port of your ST. If you are one of the poor souls (like myself) that have the old 520, there is a problem. You plug Synchro in to the printer port, but the drive connector plugs in to the back of your second disk drive. In other words, you leave drive A plugged in to the back of your ST, Synchro plugs in to the back of drive A, and drive B plugs in to the back of Synchro. You have to set drive A on top of your computer (by the function keys). Since I do not make daily back-ups, I can live with this small inconvenience. If you have any other model ST, you have a relatively easy setup. The one problem

I was disappointed to find out is, You can not leave Synchro connected. You will not be able to access drive B. If you do not use drive B for anything, you can leave it connected, but I have other uses for my second drive. All in all, Synchro is a great product. It works as advertised. Also included on the disk is a program to format your disk's to load quicker. I personally have not tested it. I am happy with the standard TOS format. If you have any questions on Synchro Express, you can write me at Internet: AA519@Cleveland.Freenet.edu.

****

A recession/depression will Atari survive?
By Len Stys

Ok, everyone? Ready for a recess? Oh, don't get depressed on me just because our economy is falling flat on its face! Atari's stock this Thursday dropped to an all time low of $2.50 a share! That is certainly one way to end a companies future in a country. But if I was Atari, I wouldn't get depressed over this just yet. You see, in playing the stock game, there are two pretty safe type of companies to invest in during a depression and that is a toy company and a candy company. The reason for this is because parents are usually willing to give up something that they want for what their children want even during a depression out of love. And children usually want candy and toys... And Atari does make an incredible toy but the question remains! Do parents love their children enough to dish out $179.95 on a video game unit especially when $179.95 will look like $1079.95 during the depression?? We'll have to see. But that certainly isn't my main hope for Atari! My main hope for Atari is the fact that they sell actual Macintosh and IBM look alikes (but are better of course) for about 2-3x less! Will a company buy one Macintosh or three STes during a depression especially when both do the same thing??? Will a company buy one IBM or three STes during a depression especially when both do the same thing? Or even 2 STes with IBM and Mac emulation? Atari can make money out of this depression if they play their cards right. During a depression, you play by different rules and Atari better be finding out what those will be.

****

Two different versions of the same machine?

Two interesting things that were found out during the Mini-Expo that may be of interest to you. The first thing is that the STe was running the software version of PC-Ditto with about the speed of a regular IBM PC/XT! Yes, the new STe has speed and it has power. The only other thing that needed to give it some help was a program called Quick ST II by Branch Software. Who needs any PC hardware emulation with the new STe???
The next little fact that is "seemingly" the case and we have reason to believe is true is that there were two versions of the STe released. One version seems to have major compatible problems, DMA problems, and anything else that you can think of. This version may have been sold to some Atari dealers for a special low price since it is a bugged up version.

The dealer then sells it to you for an amazingly low price (around $600)
and you end up with a buggy computer while the dealers blame Atari.
However, there is a fix disk you can get seperately which can help it
with the software incompatible problem but the DMA problem still exists.
The other version is a good version in which is being sold by Atari at a
higher price tag (for around $700). This version seems to have no
DMA problem and with the fix disk, no software compatible problem.
We put the STes through the test at the Mini-Expo and it ran EVERY SINGLE
TITLE! Believe it or not! So if you are thinking about buying an STe then
you may want to (A) Bring a whole bunch of ST software and hardware with you to
test on the machine. (B) Ask your dealer if he/she has found any problems
with the machine. (C) Make sure the price tag isn't too low unless you have
tested the machine out yourself and find nothing wrong with it. (D) Check
with all Atari dealers' STes in your community to make sure you are getting
the same computer from wherever you might buy it. (E) Do all the above- my
best advice.

Atari still hasn't confirmed if they will indeed replace all TOS 1.6
chips with TOS 1.62 so you will not need the fix disk.

If you are an Atari dealer and have a buggy STe and figured all were
alike then you might want to look into the fact that people are claiming bug
free DMA STes and find out exactly what is going on.

****

The Children of War
Constructed by Mark Leair from
information provided by Joyce Brabner

Every two years since 1984 young people from countries like South Africa,
Isreal, Palestine, Cambodia, El Salvadore, Northern Ireland, and the U.S. get
together to tour several American cities, and talk about what it's like to live
in a war zone. This year's tour also included environmental disaster areas --
three Russian teenagers from Chernobyl, and kids caught up with the cycle of
gang violence, from places like East L.A. and South Boston. (Why? Anywhere
kids are being shot in the streets is considered a war zone.)

What happened? Young people who have seen family or friends killed, who
have themselves survived torture, or been imprisoned, who have had to flee
their countries and start over as refugees, got the chance to ask other young
people in the U.S. for help waging peace. They also formed very close
friendships with each other during the tour.

These friendships are very important. Someone from El Salvador, who lost
family to death squads knows what it's like for a Cambodian teenager to live
with memories of "the killing fields." A teenager of Palestinian student's
hurt, when classmates make fun of the "terrorists!". An inner city gang member
got his head put on straight after hanging out with two South African teenagers.

What are we doing. Well, since the Children of War tours ever two years,
many children are far away from these friendships they have established, and
many times are back in the war zones that they have grown up in. To many of

these children, a simple phone call is affordably impossible, and a simple letter either takes too long, or never is received by the addressee. In an effort to allow these friendships to continue, a very small group of people in Cleveland, which include members of the Cleveland Atari Information Network (C.A.I.N.) that runs the Atari SIG on Free-Net are putting together small-inexpensive Atari computer systems for these children to hook themselves into Peace*Net. Peace*Net is an international nonprofit computer system that people from all over the world can access from their homes via a telephone modem hook-up on their personal computers.

How can you help? In order to subsidize the cost of these computer systems we are asking for donations. This can be in many forms. A cash donation of any amount can be mailed to the Children of War Project P.O. Box 21815 Cleveland, Oh 44121. Checks and mail-orders can be made payable to the Children of War. Lastly, any computer hardware donation will be considered. If you have any computer equipment (preferably Atari equipment, but other computer hardware will be considered) that you would like to donate you can send us a list to the address above or the Atari SIG telecommunication address located at the beginning of this newsletter. Please be sure to include your name, address, and telephone number. Donations are tax-deductable! Write to the above address for further details.

The Jin GOLDENImage Mouse
Review by Kevin Steele
(Reprinted from the NOAH Newsnotes by author)

Mouse reviews have got to be some of the most subjective reviews in the computing community. I mean, if the mouse works as advertised, what else is left for the reviewer to comment on besides how the mouse "felt" during use? The mouse used by your ST is, by design, the main interface between you and your computer. How it feels when you use it can make a major difference in how well you "interface" with your computer.

Ideally, the mouse should be "invisible" during use--that is, you should be able to concentrate on using the computer, and not be concerned with how you are handling the mouse. "pointing and clicking" with your mouse should be simple, intuitive, and almost second nature.OK^?

Which mouse design appeals to you depends on what you hold to be important in a mouse. Since this is going to be a very subjective review, let me fill you in on what I find important in a mouse.

First, the mouse should fit well in my hands. I like a smooth, sculpted design. Second, the buttons should be large (so I can hit them without feeling around for them), easy-to-click (I hate having to really push down a mouse button), and should have a solid, positive "click" feel when they are pressed (so when the computer doesn't respond to your double-clicks, you know it's the computer's fault and not yours). Third, the mouse should have a high tracking resolution. In simple english, this means that the mouse should be capable of tracking even very minute movements. It should

also mean that the on-screen mouse cursor moves all the way across the screen without having to lift the mouse and reposition it on the mouse pad.

The Jin Golden Image mouse fits all of these requirements, and also just so happens to be one stylish-looking piece of hardware. The mouse sports a zippy 280 dpi tracking resolution, meaning that very little movement is needed to send the cursor soaring across the screen. After the sluggish Atari mouse this may seem a bit hard to control, but after a week or so of using the Jin mouse, you'll find the Atari mouse unbearably lethargic. Unfortunately, the Jin mouse does not have a very high tracking speed, meaning that you may find the mouse cursor occasionally "going crazy" when you move the mouse too fast. (This problem is easily fixed by installing the Public Domain MACCELL2 mouse accelerator program, at the slow setting, into your AUTO folder.)

The Jin mouse has very light, responsive mouse buttons with large tops. These buttons have a nice, solid click, making double-clicking a breeze. A six-foot cord was a bit much for my needs, however. The mouse doesn't come with any instruction manual (some would ask if a manual is even needed), but the Jin mouse does come with its own mouse pad, a small smooth-surfaced pad that I found let the mouse glide over it like a wet icecube.

As you can tell, I've become rather enamored of the Jin GoldenIMAGE mouse. I'm not going to try and justify my feelings, as they are just that--feelings. I'd recommend you play around with this mouse a bit before you buy one. I'm fairly certain you'll like it, and since it retails for the same price as the Atari mouse ($49.95), it makes a wonderful replacement if your Atari mouse should ever scurry off to rodent heaven...

3280. 80 column dilemma...

Newsgroup: comp.sys.atari.8bit
Date: 1990-09-03 03:25:39 UTC
From: wilmott@zeppelin.rutgers.edu
Message-ID: <Sep.2.23.25.37.1990.2598@zeppelin.rutgers.edu>
Source record: 114834

Just been reading the latest postings about getting 80 columns on the Atari 8-bit. Some recommend using one of the PD/Shareware term programs out there, others recommend using an XEP80. In either case, I have but one question : where can you purchase composite monochrome monitors anymore? The only monitors I can find in stores these days are types for use with IBM clones. Over the years, I've gotten several software-driven 80 column term programs. Never used them much because by and large the BBS' that I called were run on Atari's and were in 40 columns. Now most of those boards have fallen by the wayside so I must either give up BBS-ing on my 800xl (unthinkable), or find a way to display 80 columns. On a 20" color TV that ain't advised. So I need to find a good 'ole monochrome monitor to save me. Anybody know of any mail-order places that still carry such things???

-Ray

3281. An article on how to access Free-Net

Newsgroup: comp.sys.atari.8bit
Date: 1990-09-03 15:55:31 UTC
From: aa399@cleveland.Freenet.Edu

==========
CLEVELAND FREENET - FEEDBACK
==========
by Francisco X DeJesus

About two months ago I read about the Cleveland Free-Net right here in Z*Net. You've probably heard something about it by now, including the fact it's absolutely free. However, if you live nowhere near Cleveland, you may be thinking how you can get to it without a not-so-free long distance phone call. All you really need is access to a computer system in the Internet network...

If your'e at college, the best way to connect to it is to use your ST as a terminal to a local computer system, for example, using Uniterm to call your campus computer system. Most colleges and universities nationwide have Internet access. If you have an account in that computer, log in as you usually would. From your system, it is a one-step process to get to the Free-Net. Type in:
"telnet freenet-in-a.cwru.edu" (no quotation marks). If it doesn't recognize the hostname, try using the IP number directly:
"telnet 129.22.8.76". Most mainframe operating systems (VMS, Unix, CMS, Music, etc.) support the Telnet command.

If you do not have an account on the local computer system, ask around to see if you may request a temporary account or if there is a 'guest' account available. Also ask about the kind of computer that answers the

phone calls. If it is what is known as a 'terminal server', you have to connect from there to the actual computer that you want to use (for example, you type in something like 'connect LOCALCOMP' and then your'e asked for your username and password to log in). If this is the case, some terminal servers will allow you to use the Internet directly: type in "connect 129.22.8.76". A last resort is to visit some of the local microcomputer labs in your school. Find out if they are plugged into your campus network (usually thru ethernet). If they are, you may obtain PD Telnet software for both Macs and PCs.

Once you reach the Free-Net (it takes just a few seconds to connect from anywhere in the country) you will be greeted by the title screen and an ASCII pic of the 'electronic city'. You may log in as a guest user and begin to explore the system or apply for an account (they will send you the actual application by mail). As a guest user you can go anywhere and read anything in the system, but you can't leave messages, e-mail, or chat with the other users online.

The whole Free-Net is set up like a menu-driven BBS with a city motif, and well deserved since it is HUGE! The system is extremely easy to use, and online help is available. Do check out all the SIGs, especially the Atari SIG (type "go atari" at any arrow prompt). The Atari SIG is among the largest, and (as usual) Atari users are among the most outspoken in some of the other areas. Not all SIGs are computer-oriented, and there is more than one SIG for every interest (for a complete listing of the SIGs check out the Index under the Post Office's User Services).

In all, if you have the chance, I highly recommend you try out the Cleveland Free-Net. As a first impression, the Free-Net works like any small BBS, but on such a large scale that the sheer magnitude of it still awes me (how many BBS's do you know with 96MB RAM and over 2 gig HD space? - and it's growing!). It takes very little time to feel at home there, and it's free, so go online today!

Source record: 114836

Another good terminal program is KERMIT-65, which offers 3 flavors
of screen display: regular 40 column, 40-column pannable to display
80 columns, and the previously discussed 80-column screen format.

Considering the fact that I can't afford any more hardware, the plethora
of 80-column term software has made my old 8bit system very useful.

From: robby@vax1.acs.udel.EDU
Message-ID: <6901@vax1.acs.udel.EDU>
Source record: 114838

I recently FTPed the CC65 ARC files from ATARI.ARCHIVE.UMICH.EDU.
I noticed there were MAKEFILEs for compiling and linking the
compiler on a Unix host. I haven't had to much success in
making this compiler work on a Unix host. Has anyone got this
thing to run on anything else besides an Atari 8bit???

Rob

3285. Re: CC65 C Compiler

You might try places that supply closed circuit security television systems. Be sure to ask for a *baseband video monitor if you want to use the baseband video from the computer, not a monitor that receives a signal on a TV channel. Or, if the only thing available is the TV channel kind, maybe you can use the RF modulator output from the Atari to drive it. See if you can try out the computer on the monitor before you buy.

I have fixed CC65 to cross-compile from Unix (specifically SunOS) using GCC. Sun's C compiler doesn't like the #asm directives, and GCC is portable enough (and free!) I managed to get it to cross-compile/assemble/link itself, and added backslash line continuation while I was at it. If I get enough requests I will try to make the tar.Z file available.

Gary Duzan
Time Lord
Third Regeneration

p.s. Major bummer. My keyboard is on the blink. ESC, 1-6, -, and occasionally other keys don't work. Right now I'm using the Sun 3 I used to port the above mentioned compiler.

I'm think so! The documentation that came with isn't very good. It only explains how to run the compiler, assembler, & linker. It says nothing about recompiling & linking. However, there are three files with the source archive. They are as follows:

MAKE8
MAKEFILE.ST
MAKEFILE.UNX

I assumed that MAKEFILE.UNX was a makefile for unix hosts. Did I assume wrong??

Well, as far as I know, it is 6502 specific assembly language, which means it won't work on a Unix machine..Unless you're talking about C source code, and not the compiler itself.

CC65 will effectively cross-compile from Unix, however, when set up
properly. That way you have more memory to build stuff.

From: gonzalez@bbn.com
Message-ID: <59314@bbn.BBN.COM>
Source record: 114846

A friend of my SO is having difficulty with his recently-acquired 800XL. He's a former recording engineer, so he's got some electronics smarts, but it's all analog. To add to the confusion, all I know is what he told me over the phone (he lives in upstate New York, while we live in eastern Massachusetts). Also, I haven't looked at an 800XL in nearly 10 years.

The problem is that when he powers up the machine, the display is "hashed". Judging from the description, it sounds like the scan rate is off (60Hz driving a circuit configured for 50Hz, for example). He was wondering if there was some switch that might be set wrong. Typing on the assumption that he's at the monitor level, he sees no apparent change in the screen display in response to basic commands. Does this ring any bells?

From: gdtltr@freezer.it.udel.edu
Message-ID: <29861@nigel.ee.udel.edu>
Source record: 114849

If anyone is interested in a Unix cross-compiler version of CC65, you can
(at least for now) anonymous FTP it from:

louie.udel.edu:/pub/cc65/cc65.tar.Z

I guess we can call this a Beta version. It appeared to work without problems
on a Sun 3 under SunOS 4.0.3 using GCC (Sun cc doesn't like all the #asm
directives, but I believe there is a program to comment them out.) It also
worked under SunOS 4.1 with one change to the Makefile and commenting out one
function. Let me know how it works for you.

3297. 80 col. word pros?

Newsgroup: comp.sys.atari.8bit
Date: 1990-09-09 14:19:26 UTC
From: rrwood@contact.uucp
Message-ID: <1990Sep9.141926.25790@contact.uucp>
Source record: 114851

Someone posted a note here a week or so ago about OmniWriter, the 80 column word processor available from Newell Industries with their OmniView OS upgrade. Supposedly this word processor is "seamless" in that it addresses the extended memory in an XE. My question is what is the size of the largest editable text file it will handle? And will it fully use the 1Meg upgrade they offer? (a 1Meg upgrade for only $100 bucks! Now what the hell do I do with all that memory?)

Along the same lines, does anyone know of any word pro for the 8-bits that fully uses extended memory? I've heard talk that PaperClip does, but only as a Ramdisk. I'd really like something that supports 80 columns and will efficiently allow the editing of large (50-100k) files. If you know anything about this, please respond! I've asked before and received only dead silence as an answer!

=>
=>Along the same lines, does anyone know of any word pro for the 8-bits
=>that fully uses extended memory? I've heard talk that PaperClip does,
=>but only as a Ramdisk. [...]

PaperClip supports up to 256K 8-bits. On an unmodified 130XE it should give
you about 80K of work space. On a 256K or greater XL/XE, Half of the extended
RAM is used to store the spell checker, which speeds thinks up quite a bit,
and the rest (80-90K) is work space. One note: my Newell Industries 256KXL
had some quirks made PaperClip think it only had 128K. (Soultion: scopy the
spell checker to an MIO RAMdisk and make it drive 2. Just as fast, and doesn't
go away when the computer loses power.)

I subscribe to STart, and I didn't get last month's issue of it either. Apparently there was no last issue. When I called Antic/STart's subscription offices, they said they had no explanation. I assume they are going bankrupt given the current sorry state of Atari computers. I could be wrong, but I think that the October issue will be the last one. Maybe there won't even be an issue, just an apology notice,
All this annoys me becase Atari computers have the best price/performance ratio of anything on the market, and I like to have some connection with other Atarians. Oh well, I'm saving up for a Mac II anyway, haven't seen hide nor hair of the new Ataris...

One of the best places to buy peripherals is from Computer Software
Services, the folks who sell the Black Box, Super Archiver, etc. I
know for a fact that they have disk drives and monitors in stock. Don't
know about modems though. This kind of stuff isn't their regular
business, though, so they don't regularly stock these items. If they
have extras laying around, stuff they may have purchased in a quantity
at a good price, they'll be glad to it to you.

The person who will answer the phone is Ron. Their number is
716-586-5545. Tell Ron I sent ya.

What I've heard is that Antic has indeed ceased publi-
cation. Current subscriptions will be transferred to STart
subscriptions, with two STart issues for every Antic issue
you were owed. The next STart issue is to be October's.
Also, you could get a refund if you wanted.

Does anyone know how much coverage STart has had for
the 8-bits, for example in number of pages devoted to them?
I'm doubtful that I'll be satisfied with just a few pages
(I heard a figure of 16 pages) in a magazine that's largely
devoted to the ST's, since I don't own an ST (nor can I afford
to get one in the near future).

PaperClip uses all the availabble memory you have and NOT as a
RAMDisk. You have to have the 130XE version of PaperClip. Back when
I had a 320XE (320K), I used to edit some really huge documents. And
it doesn't work all goofy like Atari Writer +. But the really really
nice thing about PaperClip and extra memory is when you use the
SpellChecker. It loads into memory as much of the dictionary disk as
it can and then spellchecks. In that mode, it was as fast a
spellchecker as
anything I've ever used on any other machine.

Message-ID: <49700043@uxa.cso.uiuc.edu>
Source record: 114710

Although this company doesn't have anything that you need, ICD inc.
is a company dedicated to 8bitters, as well as having an ST product line.
Maybe you could get good advice on Atari-manufactured peripherals,
as well as third-party manufacturers. The address & numbers:

ICD, inc.
1220 Rock Street
Rockford, Ill 61101-1437

voice (815) 968-2228
BBS (815) 968-2229, 300-9600

Maybe I'm being naive, but I would recommend the Atari double-sided,
double density drive (I think it's model 1551 or something). I don't
know where to find it.

A good idea is to pick up the COMPUTER SHOPPER, a big catalog of
computers and related equipment. Although it has little or no info
on Atari dealers, it's a good place to look for deals on cheap
modems and the like (if you want to buy new stuff). Maybe it does
have Atari 8bit dealer information; I'm not sure.

Hope this helped.

I was looking through the October STart over the weekend. It is
at the newsstands now. I didn't count the pages, but I would say
that 16 is about right. That includes the articles and the pages
for the BASIC listings for the programs. I didn't buy the issue
I was looking at because it was only available with the ST disk for
about $12.95. I didn't see any of the articles that I really wanted
to have either. There was no offer to get the 8bit programs listed on
disk that I could see. I only took a quick glance, though, so I might
have missed it.

I believe the result is undefined. In fact, some early 6502's had some
desirable side-effects of using an undocumented opcode, so programmers would
use them. Obviously a bad thing. Newer chips like the 65802 and the 65816
actually use all 256 bit patterns for opcodes. (Well, just about anyway.)
Answer: Don't do that. (0.5 :-)

Well that's depressing. I was hoping there would be an illegal opcode
trap to implement new opcodes.

Guess I won't even ask if there's an illegal memory ref trap address
to use to implement virtual memory. (0.125 :-))

The really depressing thing is: How tough could it have been? I
realise that the 6502 microcode really packs 'em in, but it's
pretty poor programming style not to handle error conditions.

The 65816 could possibly handle Virtual Memory with some extra hardware
since it has an ABORT input signal to abort the current instruction and jump
through an additional interrupt vector. I wouldn't think it possible on a 6502,
however.

=>The really depressing thing is: How tough could it have been? I
=>realise that the 6502 microcode really packs 'em in, but it's

=>
Well, I think they at least made sure that the thing doesn't get stuck in
a funny state when the illegal opcodes are refernced. I can't speak to the
complexity issue; I gave up EE long ago. (Three whole years. :-) The only
argument I can give for their decision was to keep the chip simple. By the way,
I'm pretty sure the 65C02 made all the unused opcodes NOP's.

=>
=>|"Oh boy, virtual memory! Now I'm gonna make myself a REALLY BIG ram disk!" |

Sounds good to me. The Bullet File System (Amoeba) does something pretty
close to this. It seems to be getting more popular.

Craig Lennox asks:
>What does the 6502 do when it encounters an illegal
>opcode? Does it just halt, as in a BRK, or can you have
>it branch to a trap address?

The 6502 does several things. Sometimes it executes the illegal instruction, sometimes it hangs (and I think a powerdown is required to reset it), and sometimes it executes a NOP. The 65C02 chip executes NOPs when it encounters an illegal instruction, as does the 65802 and 65816. To my knowledge, none of the chips simply HALTs or branches to a trap address. For the 6502, however, you can actually build a circuit that can detect most of the illegal opcodes, and cause an interrupt if one is about to be executed. If you want more information on this, send me email. A more attractive way of avoiding illegal opcodes is to use the 65C02 however. :)

To simulate this, use the BRK opcode.

>
>Guess I won't even ask if there's an illegal memory ref trap address
>to use to implement virtual memory. (0.125 :-))

To simulate this, wire up a circuit that generates an interrupt if virtual memory is accessed.

Of course, the solution is to simply use a 68000. It has everything you are looking for I think.

>
>The really depressing thing is: How tough could it have been? I

The 6502 has no microcode at all. It's hard-wired. (One of those very
early RISC chips 8-)

>The really depressing thing is: How tough could it have been? I
>realise that the 6502 microcode really packs 'em in, but it's
>pretty poor programming style not to handle error conditions.

There's worse. Early 6502s (pre June '76) didn't have ROR.

There were some articles eight or nine years ago that discussed the
"undocumented" 6502 instructions (for some particular mask-version of the
chip, I suppose). Some of them were pretty odd, like "Store A Immediate"
or (memory begins to fail me now:) "TYA and increment S."

More trivia: Leonard Tramiel claimed that the world's record for a "stock"
6502 is 25 Mhz (sans cooling -- the champ got REAL hot before it died).
Anyone for a dry-ice-fueled, six MIP 68K-killer? :-)

On the topic of illegal 6502 opcodes, I once heard that there was a
'Crash and Burn' instruction on the Apple II's 6502 chip (which supposedly
melts down the chip). Have any of you 8-bit enthusiasts heard of anything
like this for the 6502 in an Atari computer? I have an expendable Atari 800
at my disposal. :-)

From: cierdain@ucrmath.ucr.edu
Message-ID: <8777@ucrmath.ucr.edu>
Source record: 114728

Hi,
Months and months ago, I heard about a program that let IBM's write Atari 8-bit readable disks. Just yesterday, I noticed that a program such as this is available on the atari.archive. However, the little blurb says that it writes Mydos format disks. Unfortunately, I do not have Mydos, and, while it too is available at the archive, my only way to down load stuff for my old atari is through the IBM's at work, which means I need the Util program, which means I need Mydos...and around we go..... So, my question is, are Mydos formated disks compatible with anything else? I have copies of Dos 2.5, 3.0 and XL floating around somewhere, will any of these work? For that matter, does the IBM program work? Any and all suggestions of how I might be able to get Util and/or Mydos would be appreciated.

Thanks,
Andrew Cullum (cierdain@ucrmath.ucr.edu or Elvis@watnxt2.ucr.edu)

I have never heard of the Bullet File System. Where can I get a copy. Is
it sold by Atari dealers. I don't think my local one has heard of it
either. At least it has never been brought up at any of our User Group
meetings.

hi...

i have a smith-corona tp-1 printer and i want to use it with atari-writer.
the problem is that it witll only line-feed when atariwriter sends out a
chr(155), and not carriage return. i have solved the problem in the past
by saving the file to a file, and running a basic program that formats the
pages and send a chr(13) (^M) at the end of a line. my question is: is
there a printer driver publicly available that will do this from atari-writer?
i'm using a pretty generic printer interface, and i have a p:r:connection
that i'm only using for serial i/o but could use as a printer interface also
(if i get a cable). i've only had this problem with the tp-1, and not my
seikosha sp-1000, so it's apparently some difference in how the sp1 handles
CRLF.

thanks,

mike begley

i have been wanting to add a harddrive subsystem to my atari for some time now. i have a st-225 sitting idle and i was wondering if anyone had (or knew of) an atari-st506 type interface for sale. i have an XL so the parallel bus is available. otherwise, is it possible to hook my scsi drive that's in my AT to the atari at the same time? i know that this is grabbing at straws, but i'm looking for anything...

also, is the turbo-816 board available still? i imagine that this would be a perfect vehicle for a MINIX port, if someone wanted to take the time, but i don't seem to see any info about it anymore.

thanks,
-mike begley

I too heard about this. Whether I really believe it or not is another matter. What I heard is that it was a memory address (maybe for an i/o device) which, when written to the right way, would send some current to part of the computer which blew something. Technically, I suppose this sort of thing is possible, but what a design bug!!!

As for other 6502 opcodes, Personal Computer World (or maybe Practical Computing - which ever one had the "Subset" section) had a pretty comprehensive list of "illegal" opcodes back in 1983 (I think). The instructions were pretty weird - too weird for me to remember. What I do remember was that I saw no real use for any of them, although there were two and three byte NOPs with which you can write very sneaky code as the first byte was the NOP2 or NOP3 code and the next one or two bytes were just ignored and so could be any other instruction/data you wanted.

Of course, the use of such illegal codes is "bad practice", but then so is self modifying code and I know no-one who programs 6502 and doesn't use that :-)

Dave.

There was an APRIL FOOLS JOKE about this in an Atari magazine. It
even had a program to type in that did some silly stuff before
trashing the Display List and moving the screen memory pointers
over some active memory area (Page 0 or something) so that the
display went wack. They did get a lot of letters from people who
didn't get the joke.

There was (is) absolutely NO WAY to harm the computer through software.
I am absolutely positive about the Atari, & Apple. I have heard
rumors about the Commodore PET possibly having this problem, but
I don't believe it for a second.

Sure you could rig up someting to trigger a bomb when you run it, but
don't waste our time posting silly stuff like that.

There was an op code on the old Motorola 6800 named HCF (for halt and catch fire). It stopped all other operations, reset the PC, and started accessing memory sequentially (from $0000 to $FFFF) at its maximum speed. Supposedly Motorola designed it as a test feature. No such thing carried over onto the 6502, though.

The IBM->Atari programs write double density Atari DOS 2.0 compatible disks.
With the exception of a few (weird) Atari DOSes, all DOSes for the Atari can
read this format. I suspect that the authors of the program simply didn't
think that Atari DOS 2.0 supported double density.

Well, in my defense, I heard about this with regards to an Apple (I think),
and from a 3rd party. So if he got it from a magazine, I guess he (we) are
the fools :-)

As for wacky display lists, I have seen some great special effects on the XL
and Amiga due to software crashes which trash the screen info (eg display list
pointer on the XL). In fact, I think I've probably seen more impressive
scrolling, moving graphics during crashes than I have in games!!!! Of course,
seeing your screen bounce up an down, scrolling, changing size etc,etc may
look a little out of place in most games!!! :-)

Dave (older and wiser).

Don't take the title too seriously -- I _DON'T_ have any info on an opcode, per se, but I do know a little bit about the history of opcodes that burn out computers.

Whomever mentioned that "it wasn't the opcode, but a memory or hardware address or register that did it" was correct. I believe there was a controlling register in the early IBM PC that controlled whether or not the CRT flyback transformer signal was generated and/or actually directed to the transformer itself; apparently it was possible to send a particular control bit value to the register which caused the signal sent to the transformer to become straight DC current, burning out the whole video subsystem. POOF!

(I heard something even earlier than this, attributed to the Commdore PET computer, but don't know the details.)

The way I heard it, the PET had the monitor built in, and had full control
over screen width and height. All you had to do was reduce the screen to a
single dot in the middle, and it would slowly fry the monitor.
I also heard that the Vic-20 had a location that cross-wired an I/O port,
causing a power surge into the circuits.
This is all rumor and heresay. I haven't seen/performed any of these.

It was a single POKE command on the Commodore PET. An early issue of
Compute! Magazine (1982? 83?) actually gave the POKE command; it allowed
the video display chip to run faster. Left unchecked, this would eventually
burn out the display chip.

3337. Term Programs and the SX212

Newsgroup: comp.sys.atari.8bit
Date: 1990-09-23 02:55:55 UTC
From: umhild11@ccu.umanitoba.ca
Message-ID: <1990Sep23.025555.3479@ccu.umanitoba.ca>
Source record: 114741

A couple months ago I was playing around with Action! trying to write a term program, and I encountered a very strange problem. First of all, my program was simple in the extreme - it only has the very basic I/O necessary for functioning. Here is what the problem was then: I was trying to run the program at 1200bps, and this seemed to work okay - until I hit the 'A' key (to enter a modem command) at which point it would drop down to 300bps.

What is even stranger is that I could call out at 300bps. You see, I have a 1 Meg MIO, and am using the RS-232 interface to connect to my SX212 modem. With most term programs, if I try to run at 300bps, the program will dial, and then get a 'fake carrier' which causes it to connect. The 'fake carrier' immediately disappears after the 'CONNECT' message, and I get the 'NO CARRIER' message. So I never call anywhere at 300bps. No loss.

I recently acquired the VT52A.ACT program (from some remote site, I don't know which one, I recently moved, and my list is packed away) and it has the same problem as my 'home-brewed' term program. BobTerm 1.20 (and the old 1.10), 850 Express! and VT-10^2 all work just fine.

So does _anyone_ know what the h*ll is going on?

Jeff

BDT Burn Data Tree
BE Branch Everywhere
BEW Branch Either Way
BF Belch Fire
BFF Branch and Form Feed
BFM Be Fruitful and Multiply
BH Branch and Hang
BIR Branch Inside Ranch
BIRM Branch on index register missing
BLC Branch and Loop Continuous
BLI Branch and Loop Infinite
BLM Branch, Like, Maybe
BLMWM Branch, Like, Maybe, Wow, Man
BLP Boot from Line Printer
BLR Branch and Lose Return
BLSH Buy Low, Sell High
BM Branch Maybe
BMI Branch on Missing Index
BMI Branch to Muncee, Immediate
BMP Branch and Make Popcorn
BMR Branch Multiple Registers
BNA Branch to Nonexistant Address
BNCB Branch and Never Come Back
BNR Branch for No Reason
BOB Branch on Bug
BOD Beat on the Disk
BOD Branch on Operator Desperate
BOH Branch on Humidity
BOHP Bribe operator for higher priority
BOI Byte Operator Immediately
BOP Boot OPerator
BOT Branch On Tree
BPB Branch on Program Bug
BPDI Be Polite, Don't Interrupt
BPIM Bury Programmer in Manuals
BPL Branch PLease
BPO Branch on Power Off
BPP Branch & Pull Plug
BR Byte and Run
BRA Branch to Random Address
BRI Branch Indefiniteley

BRO BRanch to Oblivion
BRSS Branch on Sunspot
BS Behave Strangely
BSC Branch on Second Coming
BSI Backup Sewer Immediately
BSM Branch and Scramble Memory
BSO Branch on sleepy operator
BSP Backspace Punch
BSR Branch and Stomp Registers
BSST BackSpace and Stretch Tape
BST Backspace and Stretch Tape
BTD Byte The Dust
BTD Branch on Time of Day
BTJ Branch and Turn Japanese
BTO Branch To Oblivion
BTW Branch on Third Wednesday
BU Branch Unexpectedly
BVS Branch & Veer South
BW Branch on Whim
BWABL Bells, Whistles, and Blinking Lights
BWC Branch When Convenient
BWF Busy - Wait Forever
BWOP BeWilder OPerator
BYDS Beware Your Dark Side
BYTE BYte TEst

DUD Do Until Dead
DW Destroy World
DWIM Do What I Mean
DWIT Do What I'm Thinking
-E-
EA Enable Anything
EAC Emulate Acoustic Coupler
EAL Enable AC to Logic rack
EAO Enable AC to Operator
EBB Edit and Blank Buffer
EBB Empty Bit Bucket
EBR Erase Before Reading
EBRS Emit Burnt Resistor Smell
EC Eat card
ECL Early Care Lace
ECO Electrocute Computer Operator
ECP Erase Card Punch
ED Eject Disk
ED Execute Data (verrrry useful)
EDD Eat Disk and Die
EDIT Erase Data and Increment Time
EDP Emulate Debugged Program
EDR Execute Destructive Read
EDS Execute Data Segment
EEOIFNO Execute Every Other Instruction From
Now On
EEP Erase Entire Program
EFB Emulate Five-volt Battery
EFD Emulate Frisbee Using Disk Pack
EFD Eject Floppy Disk
EFE Emulate Fatal Error
EHC Emulate Headless Chicken
EIAO Execute In Any Order
EIO Erase I/O page
EIOC Execute Invalid Op-code
EIP Execute Programmer Immeditely
EJD%V EJect Disk with initial velocity V
ELP Enter Loop Permenantly
EM Emulate 407
EM Evacuate Memory
EMM Emulate More Memory
EMPC Emulate Pocket Calculator
EMSE Edit and Mark Something Else
EMSL Entire Memory Shift Left

EMT Electrocute Maintenance Technician
EMW Emulate Matag washer
ENA ENable Anything
ENF Emit Noxious Fumes
ENO Emulate No-Op
EO Electrocute Operator
EOB Execute Operator and Branch
EOI Explode On Interrupt
EOS Erase Operating System
EP Execute Programmer
EPI Execute Programmer Immediately
EPITS Execute Previous Instruction Then Skip
EPL Emulate Phone Line
EPP Eject Printer Paper
EPS Electrostatic Print and Smear
EPS Execute Program Sideways
EPSW Execute Program Status Word
EPT Erase Process Table
EPT Erase Punched Tape
ERIC Eject Random Integrated Circuit
ERM Erase Reserved Memory
EROM Erase Read Only Memory
EROS Erase Read-only Storage
ESB Eject Selectric Ball
ESC Emulate System Crash
ESD Eject Spinning Dish
ESD Eat Shit & Die
ESL Exceed Speed of Light
ESP Enable SPrinkler system
ETI Execute This Instruction
ETM Emulate Trinary Machine
EVC Execute Verbal Commands
EWD Enter Warp Drive
EWM Enter Whimsy Mode
EXI Execute Invalid Operation
EXOP Execute Operator
EXPP Execute Political Prisoner
-F-

>rumors about the Commodore PET possibly having this problem, but
>I don't believe it for a second.
>--
>Brian K. Dore' Internet : bkd@pc.usl.edu

I'm afraid you're a bit off here. Historically, there have been several
different machines with which you could destroy hardware through
software. Perhaps the most humorous was the original IBM CGA card,
which would allow you to set really extreme values in the control
registers, sending beyond-legal values to the monitor which would merrily fry.

>computer, but don't know the details.)

I *do* know a little about this 'feature' in the Commodore PETs. Apparently there was a memory location that controlled the clock speed of the processor. Altering this location was particularly useful for doing high speed screen updates. The problem was that the clock speed did not simply get bumped up to a higher rate - instead it continued to increase. If left long enough, the CPU simply burned up.

I guess that's what I get for replying to someone's signature. The BFS
has nothing whatsoever to do with Atari. In fact, it would be impossible to
implement without virtual memor and at least 24 bit virtual addresses. You
just don't get that sort of thing with a 6502 (though it would be neat to
implement it on a 65816 (Turbo-816, IIgs.))
The BFS was created for the Amoeba Distributed Operating System at the
Free University in Amsterdam, The Netherlands. It essentially maps entire
files into a virtual memory page table when they are opened. The file
system accesses the file's page table to read the file. I haven't gotten
to read up on the specifics, but that is basically the idea.

Hey---I'm looking for a fullstroke keyboard for my atari 400 (no flames, please). Either a replacement 'console' keyboard or an external keyboard would be fine.

if you've got one of these puppies lying around I'd be thrilled to take it off your hands. . .I'd even throw in a couple of bucks into the deal. . .

and if someone does get me a new keyboard does anyone need a real nice membrane keyboard for an atari 400?
I didn't think so. . .

3347. 8-bit stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1990-09-29 01:36:33 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Sep29.013633.436@ecst.csuchico.edu>
Source record: 114751

ATARI 8-BIT STUFF FOR SALE!

Hardware:

* 1200XL Computer ($75) -- all original packaging (box, styrofoam),
power adaptor, RF modulator, cable to
connect RF modulator to computer console

* 1010 Program Recorder ($20) -- original box, cable to connect
to computer or daisy-chain to disk
drive, power adaptor

Software:

* Ghostbusters (with original disk, manual, and box) - $10

* Two BASIC cartridges - $2.50 each

* 20 blank generic 5-1/4" disks

Everything is in excellent condition, just like new. I sold some
other stuff already, and this is what's left. I used it to do a
little BASIC programming and play games from time to time. I'm
selling it because I don't use it any more. It just sits there, all
bundled up in its boxes, waiting for someone to take it. The prices I
have listed are suggested; negotiate with me and we'll see what
happens. I can probably let everything go for $80. These components
are better than reconditioned ones, since it's virtually unused. You
will be very pleased with it. I will pay shipping within the U.S.

If interested, leave message here, call me at 916-894-0887 evenings,
e-mail at ekrimen@csuchico.edu, or call Fuji BBS at 916-894-1261.

(I sure hope this .sig file works. It's my first, y' know. :^)

>>>>> On 4 Oct 90 03:47:32 GMT, norlin@uokmax.ecn.uoknor.edu (Norman Lin) said:

> Well, the subject line basically says it all.

Not really. Double Density is a standard format for Atari disks. The
subject header should have "single density" in place of "standard".

> There are a couple of programs
> out there that read/write double density Atari diskettes, but are there any
> that can access Atari single density (88K) diskettes? "Enhanced" density
> (128K)? I have not been able to find any, and would like to know if it is
> possible/has been done.

If you can read and write "enhanced" density diskettes, then you
probably have a 1050 drive. Have you considered upgrading your 1050
to handle double density, with something like the U.S. Doubler chip?
You get two benefits in one that way.

On a related subect, Has anyone else had difficulties with the "util"
program that was posted recently? I tried using it to transfer some
files using a genuine IBM PC/AT. On many of the files, it didn't copy
over the entire file -- only one sector. On the files it did copy
properly, it was so slow that I would have been better off downloading
them via modem (except that I don't have an 850 interface module).

Yes, Computer Software Services is a good company.

They very much support the 8bit with all sorts of need gadgets, all reasonably priced with good documentation and continual updates. Their service is outstanding, if you ever question their product they will happily fix your computer, drive, etc... Rare to find this kind of service anywhere anymore.

I sent them my Black Box which I was having trouble with. Seems I stripped a lead to my GTIA upon installing the Black Box in the cart slot. I sent it off to them, they fixed my XE, installed a "extra Turbo XE" needo operating system that just happened to be lying around, socketed my whole 130 for me, and made my RAM upgrade a little more compatible, send the whole unit back and it has been working great ever since. They didn't charge me a dime, by the way, not even for shipping.

Not affiliated with them just a very impressed customer,
Their phone is 716-586-5545 in case you lost it.

Chris

Enhanced density disk: Yes, it could be done with minor modifications to the existing program. No, as far as I know, it has not been done.

Single density disk: I think it could be done, but would require substituting an assembly routine for code that usually resides in the BIOS ROM. Not likely to end up being very portable, and probably not worth the effort.

What does everyone think of the new Start? I cancelled my ANTIC subscription; there are many NEWSLETTERS out there that are better 8-bit sourced than the new START. If the magazine keeps getting thinner at the rate it has been, then the 8-bit section should be gone completely in several more months.

I am interested in putting up Usenet messages on my Atari 8-bit BBS; I already have Delphi, GEnie, and Compuserve messages online for those who don't have access to these services. I was wondering what the easiest way to write a viewer for Usenet messages would be. I am just learning the system -- is there a way to view 'New' messages without pauses between them? What I really need is a way to capture the messages without pauses between individual posts.

Does anyone out there have any old Corvus equipment? Anyone running a BBS with Carina 1 anymore?

3356. Re: Thinking of Buying an ST.

I hate to say it, but in addition to four or five Atari 8-bit systems
I also have an Amiga, and let me just point out that the Amiga does
all the stuff you claim for the ST (Mac and PC emulation, e.g.) PLUS
can multi-task (actually RUN more than one thing at a tim -- I regularly
download from Portal and play a video game on the system at the SAME
time...

Far be it from me to say any particular computer is better or worse than
any other, but if all you're interested in is emulation of OTHER computers,
you might as well get those AND some other nifty stuff. Emulate the PC
in one window, and do something else in another at the same time, heheh...

Note: I don't have full details on what it takes to do all this stuff, as
I have access to real PCs and Macs and don't bother with the emulators;
I DO have a friend who does this though: write to aegnor@bsu-cs.bsu.edu
for a well-considered and knowledgeable response.

When tranferring disks from the IBM format to the Atari format.....

the program that have tried works....(It is the one that also gives you the
turbo pascal source code)

what you majorly need is:
1)A double sided, double density drive(i.e. the newest drive -not the 1050)
2)A dos that will save programs is the dos2.0 format

dos 2.0,2.5, and 3.0 don't work (can't write on double density drives)
and spartados doesn't write on disks in the 2.0 format.....
If you really have some old dos'es then perhaps topdos or OS/2 COULD do it

precautions to all this:
make sure the drive you format the disks on uses the centre hub notch....
the 1050 does not.....the IBM drive does.........

if there is some inventive IBM programer out there , the turbo pascal source
COULD concievablely be modified to read single density drives, and MSDOS could
be setup to format single density, but then you would still have to remake
VTOC.....(No, you cannot format the disk in a 1050 on the atari and port
due to the warning in the precaution) an ATR8000 IBM compartible drive is
perfect for this porting....(I should know, I got the program to read
directories off my MyDos4.51(?) disks formatted in double density from that
drive...)

If you have a spare Atari drive, maybe you could remove the Atari interface and connect the drive to the IBM PC's disk controller? Then the PC could read/write Atari single density disks. This assumes: that the drive mechanism and the board that lives just above the heads, etc. is enough similar to the regular PC disk drives. Also that you have a spare Atari drive, and that you don't mind wasting the space inside your PC for an otherwise useless drive. Assuming that any of the above can be made to work. Even if the PC can make the single density drive do something, someone would have to write a program so that the PC can find the Atari's disk DOS stuff (VTOL table, if I remember correctly). Anyone try such a thing?

>
>dos 2.0,2.5, and 3.0 don't work (can't write on double density drives)
>and spartados doesn't write on disks in the 2.0 format.....

Dos 2.5 will not read or write in double density. I think Dos 3.0 will
but DON'T EVER use that Dos for ANYTHING.
Spartados (versions 2.x+) WILL read, write, and everything else in Atari
DOS 2.0 format.
Atari Dos 2.0 DOES work in double density. However, unless you have
the instructions on what locations to poke, you won't be able to use it.

Mydos, SmartDos, SuperDos, and probably a few I've forgotten (add TopDOS
also) will all read and write in double density.

>If you really have some old dos'es then perhaps topdos or OS/2 COULD do it
>
>precautions to all this:
>make sure the drive you format the disks on uses the centre hub notch....
>the 1050 does not.....the IBM drive does.........

Ignore this, it ain't true. What is true is that you should have a
well aligned drive in both the IBM and the Atari.

Forget it, Atari compatible drives do not have the proper interface
in them to connect to a PC without major electronics design. This is
definitely true for the 810, 1050, Indus, Rana. Percom and the SX551
may be different, but you probably would not want to sacrifice them.

A much more straightforward approach would be to talk to the SIO port
through a serial port on the PC. All you would need there are level
converters, the SIO protocol is 19.2 kb serial.

(I am assuming you know what an ATR8000 is.)
(fabulous piece of equipment)

ATR8000 (64k) + 2 DD drives

(also a 13" composite color monitor
and a powercordless 800xl)

All can be had for $300... (Don't think it's reasonable, email me)

Why selling: Cause I don't use Atari 8bits anymore...
(Well, the equipment is an overkill for
playing games, and that's all I ever do
with it anymore)
Equipment as good as new.

3363. Whats the best GIF viewer?

Newsgroup: comp.sys.atari.8bit
Date: 1990-10-11 01:31:32 UTC
From: rmartin@remus.rutgers.edu
Message-ID: <Oct.10.21.31.31.1990.8636@remus.rutgers.edu>
Source record: 114667

What is the best GIF file viewer for the 8bits? Can any of them take
advantage of the XE's extra bank? Can any display 640x420 or 1152x900
gifs with resonable clarity? Thanks-
-Rich

3364. Re: Whats the best GIF viewer?

From: potter@sunwhere.DAB.GE.COM
Message-ID: <6192@ge-dab.GE.COM>
Source record: 114668

There are only two GIF viewers for the 8-bit: my APACVIEW which
displays in graphics 9 and (256-color) APAC mode, and Don Davis's
ATVIEW8. Neither can use the XE's extra banks of RAM (except as
a RAM disk external to the workings of the viewer). I know mine
can only display files as wide as 720 pixels before it starts
overwriting other areas of memory (never tried it). Don's ATVIEW8
displays in graphics 15, so it might have the edge on clarity on
line drawings. APACVIEW does a great job with most continuous-tone
digitized photos (IMHO), especially if your monitor accepts APAC mode.
I'm updating APACVIEW to display in graphics 15, in four or 64 colors
with funny display lists and multiple page-flipping. Let me know
if you are interested.

I second the motion that Jeff's APACVIEW does the better job in general.
I have tried both viewers on several different files and have yet to
see APACVIEW loose, although in some cases, it is hard to tell the
difference.

> I'm updating APACVIEW to display in graphics 15, in four or 64 colors

3366. PC to Atari - bug found

Newsgroup: comp.sys.atari.8bit
Date: 1990-10-15 15:26:32 UTC
From: mrp@cbnewsd.att.com
Message-ID: <1990Oct15.152632.28304@cbnewsd.att.com>
Source record: 114670

I uncovered a bug in the recently posted source code (thanks Chris!)
for the PC to Atari utility. I was using the Turbo C (Borland) compiler
on an AT&T 6300 WGS and it gave me a warning message on line 236 of util.c.

What you need to do is change an = to an ==. The following is the line:

```
if(cmd = 'D')
to
if (cmd == 'D')
```

I'm not sure that this bug is actually a problem since the code seems to
be trying to deal with directories. I wasn't aware of any support for
directories being available in this utility, perhaps it's an uncompleted
piece of code? Also, since there's a /T80 switch, does it support 720K
3.5" drives?

Anyway, I was able to compile the utility using Turbo C and the MASM
assembler (Microsoft) and it works. I was able to format floppies
on my 6300 WGS running MS-DOS 3.3. I then wrote 2 ASCII files to the
disks and was able to successfully read the files in on my Atari 800
with my 1050 drive and SpartaDOS X.

I WASN'T able to successfully write the util.exe file to the formatted
disks even though I WAS using the /B (inary) switch on the command line.
The problem that I encounter is that the util.exe file gets truncated
and I can't read back an exact copy of what I write to the disk. I'll
have to look into this further and see what I can determine.

If you're in a pinch, you could uuencode the binary and then transfer it
in ASCII. Then, you'd just have to uudecode it on your Atari. The utility
program does translate the ASCII into ATASCII unless you use /B when you
write the files (that's a nice touch).

Later on folks!

A friend of mine has some trouble with the game ZORK I
on his commodore 64.
I know it is an rather old game, but maybe there are
still some people out there who can help him.

His problem is that he can't get in to the Hades.
He knows that he has to light a candle, ring a bell
and shout some magic word.
He doesn't know this word, so he is getting nowhere.

If somebody know the solution to this problem, please, please
write to me.
(Don't post the answer to this newsgroup because I'm not
in a position to read it. Besides it would be a waste of
money to post it all over the world.)

Thanks,

American Techna-Vision has AtariWriter+ and Spellcheck for $29.95.
To order, call toll free 1-800-551-9995

B&C ComputerVisions has the same package for $44.95.
To order, call 1-408-740-1003.

Both places have a large selection of other 8bit software also.
Call for a catalog or pick up the latest issue of STart. They
both have an ad in there.

3371. Real Chroma from my 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1990-10-17 04:37:59 UTC
From: umhild11@ccu.umanitoba.ca
Message-ID: <1990Oct17.043759.21016@ccu.umanitoba.ca>
Source record: 114675

I was just telling a few friends from the local user-group that the "chroma" pin on Atari XLs (and XEs?) doesn't produce a pure chroma output, and that the modifications necessary were simple, had been posted to this newsgroup, and that I had a copy of it. Well, two out of three ain't bad (sorry). I can not find a copy of that mod anywhere, so could some kind soul PLEASE send it to me so that I don't look like a complete moron?

While I'm asking for upgrade docs, does anyone have the information on how to add another PIA and regain the four joystick bliss of an 800? I was looking forward to that one, but it seems to have passed me by.

Thanks in advance.

Jeff

3372. Atari 1450XLD

Newsgroup: comp.sys.atari.8bit

A liquidator which bought out Federated's stock is having a big sale in San Jose - they've got three 1450XLD's! No box, power supply, just the case, and they are in pretty bad shape - one has function key markings in magic marker, labels are missing, etc. They all have both drives. No price, I imagine $10 would take one.

Message-ID: <1990Oct18.011648.12378@ccu.umanitoba.ca>
Source record: 114677

I just discovered that I have a bunch of wonderful files on my hard disk that I simply can NOT erase. I am using SpartaDOS X. I downloaded the files into a subdirectory previously, and successfully un-arced them. Then I lost those copies, and downloaded them again. Now they will not delete, and they also can not be un-arced. It is my suspicion that the sector maps for these files may somehow have been corrupted. Is there any way at all that I can fix these things up, or will I have to archive and reformat (yet again!!!)?

From: james@sauron.Columbia.NCR.COM
Message-ID: <2396@sauron.Columbia.NCR.COM>
Source record: 114681

I was just wondering why the 8-bit atari machines don't have a binaries group. Is no one writing anything for these machines anymore? Is there no shareware or freeware around?

I can't access the archive sites other than through mail servers. It would be nice if I could share some programs with the rest of you (when I find a modem for the 8-bit machines, that is).

I have an old 400 that just quit working. I am trying to find someone to service it. If I get it fixed, or get another 8-bit machine and a modem, I will gladly share what I have written. I just need an archiver from out there in net land.

I've had SDX for a while, so I'm familiar with prtotected and hidden mode, those were the first things I looked for. What I neglected to mention is that when I type ERASE ACEC.ARC (for example) it seems to read a little stuff off the disk and then lock up. The RESET key can be safely hit - the file is not flagged as deleted yet.

More importantly though, what is CLEANUP.COM, and where can I get a copy (since I don't seem to have one)? I do have FTP access here, so if you could name a site, or send me the UUencoded file I would really appreciate it.

Jeff

Message-ID: <35026@cup.portal.com>
Source record: 114686

Re: 1030 no docs, no ps.

Power supply - actually, 9vac is probably better for the thing, can't remember exactly.

Docs, etc - get Bobterm and use the xm301 or 1030 handler that comes with it.

The reason the 1030 does not respond to the hayes command set is because it isn't hayes compatible. A really stupid thing to do in this day and age, but then Atari has never really been known for its brilliance.

Re: Baud

Sorry, it is stuck at 300 baud. For an interesting, but useless, term program remove all cartridges from your computer, unplug all SIO devices except the 1030, and then turn on your computer. (If using an XL/XE hold down the option key to disable basic.)

The Atari 8-bits were doomed to obsolescence a long time ago,
regardless of the effects piracy and bad management had on the
machine. Out of all its contemporaries, only the Commodore 64
remained viable to today, and even then that machine is rapidly dying
its death.

The Atari 8-bits were advanced, innovative, ground-breaking machines
in their day. But progress marches forward...

From: jmm@cloe.gti.upm.es
Message-ID: <1165@cloe.gti.upm.es>
Source record: 114688

Hello world!

I'm an Spanish 800XL owner (whose English is not very good, by the way), who got really surprised by the amount of still Atari 8-bits friends there. I must confess that I parked my old machine when I left the University and started working in a image processing research group, with PC's and Sun workstations.

Reading the news, I found that it's possible to establish some kind of communication between a PC and my old 8-bits machine. I would be very thankful if somebody could help me in this way. I would also apreciate any kind of information concerning the possibility of displaying gray-scale images on the screen.

My stuff is very reduced: I have the previous mentioned 800XL, a disk drive (1050 I think), the 850 module for connecting a parallel printer, and some broken joysticks.

Thanks in advance,

Jose Manuel.

CLEANUP.COM is a utility from ICD. It comes with the SpartaDOS ToolKit
(price unknown).
Alternatives...there aren't any really, but if you understand the disk
structure you can use DISKRX.COM (also in the toolkit) or FIXDMP.OBJ.
DISKRX.COM allows you to edit spartados disks. It is a really nice utility
to have.
FIXDMP.OBJ is a disk editor also, originally written by Atari for use with
DOS 2.0. It will work with a SpartaDOS disk, but you really have to know what
you are doing. The same holds true for any disk editor. FIXDMP.OBJ was
released to the general public some time ago, so while it is copyrighted, you
can legally use it and it can be distributed. If you want this, I'll be happy
to uuencode it and post it to this newsgroup. It is only about 4k long.

New 8-Bit Product

by Roger Heller - JACS
Reprinted from Between Bytes - 6/90

Perhaps this item belongs in the LETTERS TO THE EDITOR column, but it strikes me as such a novel idea that I decided to give it an article of its own.
As you are probably aware, the world is getting overcrowded with IBM PC's, XT's, AT's, and their clones as well as 386- and 486- based computers that are called "industry standard" but aren't really clones of anything. Whether you like them or not, they are powerful computers. They have lots of memory (the smallest ever made had 128K), they have big floppy disks (small ones have 360K), and they usually have hard disk with megs and megs of space. Just what the Atari hobbyist needs!
The problem is that they aren't compatible with Ataris. The disks use a different format. An 8-bit Atari couldn't address all that memory, even if it had it. If you have an industry standard computer you have all that power sitting ardound with no way to use it on your Atari.
Well, maybe there is a point of compatibility. The PC has a serial port that just deals in the bits and bytes of transmitted data -- ASCII text, binary files, anything you want to transmit. The Atari's SIO deals in just the same things. If only they could talk to each other!
Nick Kennedy, an electrical engineer from Russelville, Arkansas had the idea. He isn't a computer professional, but he is an Atari hobbyist, and he is interested in data interfacing. He put together a little box and a few cables, and it worked so well he's selling them now.
SIO2PC is a system that allows you to store Atari programs and data on the PC's disk and to use the PC's memory as one or more ramdisks. The hardware part allows the Atari SIO to connect directly to an RS-232 port (the PC's serial port). The Atari doesn't need an 850 interface or any communications software or drivers.
The software part runs on the PC. It is an Atari disk emulator with PC file I/O capability. With it you can set up Atari ramdisks in the PC's ram space. You can load these ramdisks with files and data from your Atari, and you can save them to the PC's hard and floppy disks. Once you get your Atari software on the PC, you can boot your Atari from the PC without even having an Atari disk drive connected.

FEATURES - You can:

> create 1 to 4 ramdisks

>Write the ramdisks to a PC disk file

>Load the PC disk file back into a ramdisk

>Use PC COM port 1 to 4 for the SIO2PC connection

> Change ramdisk ID numbers

>Choose from 4 ramdisk sizes

>Format in normal density, DOS 2.5 density, or double density

>Use PC batch files to automate set-up of SIO2PC

Future features:

>"Remote control" program to control the PC from your Atari

>PC to switch ramdisk ID's automatically for rebooting

>SIO2PC to run in background on the PC as a TSR (so someone else can work with the PC while you're using it as a disk/ramdisk manager)

>Utility to convert PC files to Atari files (download files with the PC and then convert them to Atari format, create PC files with an editor or word processor and then use them on the Atari).

Now working and included:

>Print on a printer attached to the PC

>Convert Atari files to PC format in order to work with them on the PC

Now the business talk: The price of SIO2PC, complete with cables and connectors is only $49.95. He promises your money back if it doesn't work, and no more than $5 for upgrades. For the real hobbyist, a kit of all parts, box, etc, is available for $35.
This sounds like the best idea that has come down the pike for a while. Much better than using an old Atari as a printer buffer! I'll have copies of his letter and feature sheet at the meeting.

Hello again, world!!

In my previous message, I said:

> Reading the news, I found that it's possible to establish some kind of
> communication between a PC and my old 8-bits machine.

Well, I have received two answers, and I thing I am going to try first
the one from Chris_F_Chiesa: MYDOS program.

Chris sent me an e-mail, saying that the executable code for MYDOS was
posted in May, and the source one a few weeks ago. Could someone re-post it for
me, please ? I don't care if it is executable or source code.

Thank you, Frank E. Seipel, for your kind answer. SIO2PC seems to be
another interesting possibility. I will consider it.

I am currently resurrecting my old Atari 800XL system. (Last night,
I successfully downloaded some 8-bit software from "terminator".

I have "AtariArtist" and an OKIMATE 20 colour printer.....does
anybody know of PD software, or even a cheap commercial programme,
which will allow me to print out my "AtariArtist" picture files on
my colour printer, without a lot of fussing around ?

If you do, how can I get a hold of a copy ?

If you are not Mr. Barrett, please press "n"

I am having problems sending out to Mr. Barrett, but you are having
no trouble sending to me.
I asked if you were selling them all as a pakage a $5.00 or $5.00 each?
Either way I want War Games.
If it is $5.00 altogether then I also want the last two that were "good games"
By the way where do you live?

3395. Dead 850/800 transformer? HELP!

Newsgroup: comp.sys.atari.8bit
Date: 1990-10-28 20:29:33 UTC
From: garlow@lpl.arizona.edu
Message-ID: <346@organpipe.UUCP>
Source record: 114699

Hi! I had a crisis with my computer which I'm going to describe in the hopes that one or more of you can help me out...

I was using AtariWriter on my Atari 800. I tried to print something out and nothing happened, which was when I noticed that the power LED on the 850 printer interface wasn't lit. I checked that it was turned on, tested the power cord, and finally decided that either the 850 or its power transformer was dead.

I noticed that the transformer which powers the 800 was identical to that of the 850 (same product number, etc.), so I thought I could verify which was bad (the 850 or its transformer) by switching the transformers between the 800 and the 850. It seemed like a harmless idea at the time.

Unfortunately, not only didn't either one work, but when I switched my computer back to its own tranformer, it no longer worked (no power indication-- nothing). Yikes! What could have happened? Here are three hypotheses:

1) Both transformers chose to die within several minutes of each other, but there was no cause and effect involved.

2) The 850's transformer "went bad" and damaged not only the 850, but the 800 as well.

3) The 850 "went bad" and damaged not only the 850's transformer, but the 800's as well.

Which of these hypotheses sounds most plausible from a technical standpoint?

I'd appreciate any suggestions on how to determine what happened, as well as where I might be able to mail order a new power supply (or whatever would be required to fix the 800 computer and 850 interface). There are no dealers in town.

Post any replies, OR email to:
garlow@hindmost.lpl.arizona.edu
and I will follow up with a summary. Thanks!

Kevin Garlow

> transformer, but the 800's as well.

There is a fuse inside the transformer's plastic housing. It is possible that a defect in the 850 blew fuses in both of your transformers. It is possible to repair the transformers by gently squeezing the plastic housing at the joint in a vise. This should crack the glued joint enough so you can pry it open. then look at the fuse and replace it if bad.
Then the next question is what may be wrong with the 850. Open the plastic housing and inspect the power connector for a short. Beyond this, you'll need some electronics smarts to find the problem. Probably a defect in its ac to dc conversion circuits.

3397. MIDI interface?

Newsgroup: comp.sys.atari.8bit
Date: 1990-10-30 03:32:19 UTC
From: ez001500@astro.Ucdavis.EDU
Message-ID: <9135@aggie.ucdavis.edu>
Source record: 114701

Hello all! A musician friend of mine is interested in using his atari in conjuction with his various synthesizers via MIDI and he was asking me for help. I (being utterly ignorant in such matters) promised I'd post a note to solicit help. He has some program or another which allows him to compose & control play and parameters (I forget its name), which works fine, but apparently it doesn't allow him to store track (or voice?) information on disk (he currently dumps it to a cassette tape -- reading it back is prohibitively slow).

We wish therefore to write our own code to interface with MIDI and his synths. Has anyone done this? As near as I can determine, it may be possible to treat the MIDI as a separate device, writing a device handler to access it. This is a fine idea, except I don't know how to write device handlers (a small technicality... :)). Has anyone done this?

i) someone's software to interface with MIDI that I could look at (and possibly cannibalize)
ii) a sample device handler for something non-trivial (i.e. not the null device handler!) that I could use to model a MIDI handler on
iii) a better way of doing all of this if it exists!

Also, if you're a musician and've used your atari in any major way, drop me a note -- my friend (and I) would love to hear from you. He currently uses his atari in conjunction with this (for the moment nameless) program, and the results he gets are great!

Thanks for the help! I've always had a fondness for my 8-bit -- it'd be great to be able to extend it!

My vote is on number 3. If pressed, I would look for a dead short in the 850 somewhere that killed both power supplies. (I'm guessing that Atari didn't protect either transformer via fuse - after all, sealed units never need service, right?) Maybe there's a fuse blown in the 850, but this is unlikely - if it doesn't protect the transformer, it's not doing much.

As far as replacement goodies, I'm not sure - BRE's catalog had some 8-bit hardware stuff last I saw, but I haven't looked at a recent one. Are there no 8-bit magazines left for suppliers to advertise in?

Good luck!

Max J.

FOR SALE -- $15 (includes postage)

Hybrid Arts CZ Patch studio for the Atari 800/400/800XL/130XL

Allows the storage and retrieval of instrument patches, by name, from
the computer system. Patches are loaded into the "Cartridge" memory
area - leaving your personal area storage area intact. Will work
with any Casio CZ series synthesizer.

REQUIRES the Hybrid Arts MIDIMATE hardware MIDI interface
(not included), and a 1050 disk drive.

3400. Re: Dead 850/800 transformer

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-01 00:29:56 UTC
From: garlow@lpl.arizona.edu
Message-ID: <360@organpipe.UUCP>
Source record: 114605

This is an update on my recent post...

[I related how my 850 printer interface stopped working, and that
exchanging its power supply with that of my 800 computer had caused
the computer to stop working as well.]

In article:<111371@philabs.Philips.Com>, rfc@briar.Philips.Com (Robert Casey)
[stated that a short in the 850 interface likely blew the fuses in both
transformers, and outlined a way to repair them.]

This opinion was shared by several other people who responded to
me directly. As Robert pointed out, the fuse can be replaced IF you
can crack open the transformer case, which is not designed to be opened.
(I haven't carried out the repair yet.)

The object lesson from this is that one shouldn't switch power
supplies between working and broken components without checking out the
broken component (e.g. checking for a short).

Finally, a mail order source for new power supplies (info
supplied by Frank E. Seipel):

American Techna-Vision
1-800-551-9995
415-352-3787 (California only)
Cost is $14.50, 'Power Packs'.
Also, they sell the '850 12pc IC set -- all except ROM ' from $19.50

Thanks to Robert Casey for his post and the following people who
mailed to me directly!

3401. Paging in MAC/65

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-01 09:31:15 UTC
From: dac@ukc.ac.uk
Message-ID: <5983@harrier.ukc.ac.uk>
Source record: 114704

I've just acquired MAC/65 for my Atari 800XL. I think that it's one of those OSS Supercartridges which can be paged in and out at will (even though it's plugged into the cartridge port). This is nice as it allows access to the RAM from $A000-$BFFF.

Unfortunately I don't know how to use this feature and the manual doesn't say anything. I remembered from reading an article in Analog (I think) a couple of years back about paging out OSS BASIC and putting some DOS files under there as a RAM-disk. It mentioned addresses around $D500 for paging the cartridge. The debugger in MAC/65 certainly does not like looking at that area of memory.

If anyone really knows how to control this I would really like to know.

Thanks for any help.

Dave.

There was also an article in 'Insight: Atari' in _Compute!_ magazine
many MANY years ago. As near as I can tell, this is how the bank-switched carts
work: accessing locations $D500-$D5FF sets the CARCTL line of the cartridge
port. If your cart was not built to use this line, nothing will happen.
However, since Bill Wilkinson(?) said in his article - it is the LOCATIONS that
you access which is important, not the value you store. The only way I can see
this being useful is this: when CARCTL is set, you read the lower 8 bits of the
address line and store them in a buffer. These bits can then be used as upper
address bits. MAC/65 uses 8k of space, of which the lower 4k is permanent, and
the upper 4k is one of 4 banks => MAC/65 is a 20k cart (which is how they were
explained in Bill's article). This also explains how Atari can now have 256k
carts (I think FSII is 128k). Theoritically I think they could be much bigger,
but I suppose the decoding and stuff would take up more space than is available
in a standard sized Atari cart.

Jeff

3403. XL Expansion port & MAC/65 Paging

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-02 10:11:55 UTC
From: dac@ukc.ac.uk
Message-ID: <6008@harrier.ukc.ac.uk>
Source record: 114607

XL EXPANSION PORT

I'd like to hook up something to the XL expansion port. I want this interface to be addressed at $D600. This is the setup I hope to have:

```
------------ ------------------ ----------
| | | 2 x 74LS373 based | | |
| Atari 800XL |==| bidirectional |==| Atari ST |
| | | port with control | | |
------------ ------------------ ----------
```

The == will be short ribbon cables.
The intermediate board will consist of a couple of octal latches with tri-state op together with address decoders for each half of the connection and some logic to implement full/empty bits.

The software should give me a data transfer rate of about 70K/sec max. I want to use this to develop a cross assembler and remote debugger. I know it's a bit late in the XL's life to do this, but it's an idea I've had on the shelf for a good 5 or more years... it has to be done.

Now this is my problem... I don't have any information, other than pinouts, on the XL expansion port. I can design the hardware in terms on hard logic, but I'm not sure about capacitive loading, current, etc.

As these machines are so old there is no chance of getting any published information on the port. I read in "Mapping The Atari" that some guy had a series of articles in one of the magazines of the day on this very subject - that doesn't help...

If there's anyone out there who knows anything about this port then I would appreciate any information I can get - a better description of the pinout would be a good starter (the pinout I have is just that - a pinout, not much information on what special signals mean).
--

MAC/65 PAGING

Thanks for the replies so far about how the MAC/65 cartridge does paging. I would still like more specific information though. For example, I wrote this program:

```
; Normally, from DDT address $A000 contains $FF
; So write a number into $D500 until this changes... ie something has paged
.OPT NOLIST,OBJ
*= $4000
LDY #0
```

```
LOOP STY $D500
LDA $A000
CMP #$FF
BEQ FOUND
INY
BNE LOOP
BRK
FOUND
STY $5000
DIE
INY
STY $D01A
JMP DIE
```

Simply, when the display goes ape it's banked something. Inspection of $5000 reveals the number $7D. More tests show that if I write anything other than $7D into $D500, nothing happens... only $7D. The thing that gets paged into $A000-AFFF is the MAC/65 assembler.

Now I could waste weeks writing 100s of little test programs but I really would prefer someone who knows to tell me. I don't have back issues of Atari magazines so quoting them, although interesting from the point that the issue has been discussed, is really not much help. Of course, not much help is better than no help at all...
--

Thanks in advance for any and all information you can give me on the above topics. I'd be especially interested in hearing from people who have actually used either paged MAC/65 or the expansion port. Come on! Share it!

Dave.

3404. MAC/65 revisited...

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-03 13:44:16 UTC
From: dac@ukc.ac.uk
Message-ID: <6022@harrier.ukc.ac.uk>
Source record: 114608

Thanks to the people who responded to my request for information regarding paging the Mac/65 supercartridge in and out. I wrote a few test programs and found that this can be achieved by accessing location $D508 and it can be paged back in by accessing $D500.

It's weird to have a cartridge plugged into the XL and still be able to use the built-in BASIC (not that I use it, just for experimental purposes :-)

Dave.

PS. Info is still needed for the expansion port.

3405. Serial printer question/Users in DC

Okay, this should be an easy question for somebody to answer:

How do I convince my Epson printer to print all those neat graphics characters from within AtariWriter? I know they're there because I can print them from Atari Basic. Control-O and a decimal number between 128-255 seems to produce a corresponding character in the 0-127 range, but underlined. This strikes me as kind of bizarre. Help?

Hopfully Irrelevent Info:
I use AtariWriter 80
The printer is an Epson LX-810
I print through the XEP80 printer port

3408. PCXFER -- an overview

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-05 22:54:05 UTC
From: fseipel@hpuxa.ircc.ohio-state.edu
Message-ID: <1990Nov5.225405.1565@magnus.ircc.ohio-state.edu>
Source record: 114612

My description of UTIL.COM, also known as PCXfer

by Anthony Ramos

Have you ever dialed up a bulletin board using your 8-bit, seen IBM files, and wanted to download them to try on the PC at work? Charles Marslett, creator of MYDOS for the Atari 8-bit line, has come up with PCXfer, an amazing little IBM utility that makes an IBM disk drive format, read, and write disks that are compatible with our Atari double-density drives. Someone running a BBS on his IBM computer could load Atari files onto his hard drive directly from floppy disk, rather than receiving them over the phone. I use my 130XE to download IBM files onto disk, then use PCXfer to load them into the PC at work.
PCXfer does not make an IBM run Atari software, nor will it make an Atari run PC programs. It simply provides an easier way to swap files between PCs and 8-bits.
Execute PCXfer from the IBM's DOS prompt using these commands:

UTIL /I d: Atari formats the disk in drive d

UTIL /W d: [file1] [file2] etc.
Writes files to Atari disk in drive d (converts IBM carriage return/ line-feed pairs to Atari RETURN character)

UTIL /W /B d: [file1] [file2] etc.
Writes files to Atari disk in drive d without converting IBM carriage-return/line-feed pairs

UTIL /R d: Lists and optionally Reads all files on drive d (converts Atari RETURN characters to IBM carriage-return/line-feed pairs)

UTIL /R d: Lists and optionally Reads all files on drive d without converting Atari RETURN characters

UTIL /L d: Directory of files on Atari disk in drive d

Make sure the disk is in the drive before entering these commands. Entering UTIL with no parameters displays this list.

When PCXfer reads Atari files, it automatically replaces the Atari line-feed and carriage-return characters with IBM line-feeds and carriage-returns. This is perfect for moving text files from one computer to another. However, if you are reading a non-text file such as an IBM program, include the parameter /B to inhibit CR/LF translation. The /B parameter should also be used when writing an Atari non-text file to an Atari disk.
One more caveat: IBM floppy drives aren't very good at reading Atari disks. Maybe Atari's disk format is too sophisticated for the PC (grin), but for whatever reason, after reading a few sectors the disk drive will grind and the

message "5 Errors Reading Sector On Atari Disk" cascades down the screen. What to do?

After you've put the files you want to transfer on your Atari disk, make an identical copy of it using a sector copier such as CopyMate or MyCopyr (Don't use DOS). When PCXfer says it can't read your first disk, pop it out and put the copy in; PCXfer will continue happily, thinking the same disk is in the drive! If the copy gives you trouble, just replace it with the original. Continue this way each time PCXfer displays an error, and eventually your files will be transferred.

I have used PCXfer to transfer GIF picture files to PCs with no problem. But because an Atari 8-bit disk can only hold 180K on its front side, (the only side PCXfer can read), this is the largest file you can transfer. Sounds like a lot to an 8-bit, but many IBM files are larger than 180K. Sometimes you can get around this limitation by ARCing the file and storing the ARC on an Atari disk, then reading the file and unARCing it on the IBM. This will not work on GIFs since they don't shrink very much when ARCed.

Files whose names end with .ZIP or .LZH are especially valuable for transferring. These files are compressed, same as our .ARC files. Even though your 8-bit can't decipher them, they will become much larger when uncompressed on a PC using UnZIP or UnLZH.

Good luck using PCXfer, and I hope this program comes in handy for you.

3409. Transkey -- IBM keyboard on an 8-bit

Newsgroup: comp.sys.atari.8bit

{TRANSKEY

Hardware Review

PRODUCT DESCRIPTION:

The main emphasis of this product was to provide a means of utilizing a better quality keyboard with the Atari than the one originally provided. The modification works with the 4oo, 8oo, XL, and XE models.
Since IBM style keyboards have become so plentiful and are made in numerous configurations, it was deemed that this would be the keyboard of choice. This gives the added flexibilty of locating the keyboard where you want it, independent of the computer and it's associated peripheral equipment. Also, due to the additional function keys, cursor keys, ect., several new features are provided that could not be implemented by the original Atari keyboards. One of the most interesting of these, is the ability to send out full commands (BASIC & MAC65) with a single keypress. This and many other features will be covered in greater detail a little later on, for now let's look at what TRANSKEY is from a hardware point of view and what is involved in installing it.

THE HARDWARE

TRANSKEY is a microprocessor based translater board measuring aproximately 2.5 x 3.5 inches and is designed to fit underneath the RF shield on the Atari motherboard. The TRANSKEY board is provided with double sided tape attached to the solder side and is meant to be placed in a location where it can be sandwiched between the shield and the motherboard. The location will vary depending on what model of computer it is installed in. On the 1200XL it will be necessary to either cut the RF shield or not use it, since there is virtually no room underneath it.
On the 400/800 & all XL models, the TRANSKEY derives it's main communication and power from the Atari via a small piggy-back board that attaches to TRANSKEY with a ribbon cable. This piggy-back board is designed to be plugged into the socket where POKEY (Atari Part# C012294) would normally reside, with POKEY then plugged into the piggy-back board to complete the installation. On the unsocketed XE series machines, the installation requires soldering directly to the POKEY chip.
To fully complete the installation and assuming that one wishes to have START,SELECT,OPTION,RESET available from the remote keyboard, will require the attachment of 4 jumper wires. Three of these wires go to a single chip called CTIA or GTIA (Atari part# C014805) to tap into the option select circuitry. The point where the 4th wire for Reset goes, varies depending on the model of computer. Generally to install these jumpers, it merely requires pulling a chip out of it's socket, inserting the bared end of the jumpers into the appropriate holes in the socket, and then re-inserting the chip that was removed. Of course on the XE series it isn't possible to remove the chips, so these jumpers will

have to be soldered in place.
With TRANSKEY installed, all normal operations of the Atari are unimpaired, including the use of the stock Atari keyboard. However, with TRANSKEY and an external IBM style keyboard attached, there will no longer be any need to use the stock keyboard except for the following conditions:
When Cold-Booting from cassette tape, it will only work by pushing START from the stock keyboard prior to engaging power.
On XL/XE machines to disable Basic on Cold-Boot, it will still be necessary to push OPTION on the stock keyboard (See section 'Other Special Keys' page#3 for a way to disable basic after boot-up).
The reason for this, is that for the 1st couple seconds after powering up, the IBM style keyboards usually run a self-test which basically doesn't allow for proper recognition of a key pressed during this time. Since the Atari looks for these special key presses to occur very soon after the power is turned on, it will fail to see these with the IBM keyboard and instead just do a normal Cold Start.
The IBM keyboard is connected by means of a 5 pin DIN inline jack attached by a small ribbon cable to the TRANSKEY main board. This ribbon can be routed through an existing hole or slot on the computers case, by unplugging it from the Transkey board and then reconnecting it when done. For those of you that prefer to permanently mount this jack, it is available as a chassis style jack with mounting hardware (specify when ordering).

FEATURES

With either an XL or XE computer, almost full use of all the extra key functions on the IBM keyboard are implemented. This includes single key cursor movement, Home cursor, End of page cursor and Insert/Delete modes. Also a special Cursor Left Page/Right Page is available by pressing Page Up/Page Down respectfully. On a 400/800 machine the page movement functions are not recognized, although everything else is.
These functions are directly accessable from the number pad after powering up the system (Default), if you want to use the number pad for number entry, simply press the NUMLOCK key. These functions will still be available, but will now require a Control - Function combination to initiate. If you want to restore the default condition (single keypresses), just press the NUMLOCK key once more (pressing NUMLOCK toggles between the two modes).
The Home key has yet another use, when pressed with the Shift key it will both home the cursor and clear the screen. This is the same as Shift - Clear on a stock Atari keyboard. Pressing the Escape key prior to this combination will still print the curved arrow symbol like the stock system.
The Insert & Delete keys when pressed with Shift, will perform whole line insertions or deletions.
If a 101 key Enhanced keyboard is being used, the extra cursor control, Insert and Delete keys will work the same as their number pad counterparts, unchanged by either Shift, Control or NUMLOCK.
Perhaps one of the nicest features, is the indication of CapsLock and NumLock by led indicater lights on IBM style keyboards, that are so equipped.

The Function Keys:

On an XL or XE series machine Control F1 - F5 will provide the following special functions:

Control F1 Disables the keyboard (both stock an external) and until pressed again, all keys will be ignored by the computer.

Control F2 Disables DMA. Pressing this will cause the screen to go black until any other key is pressed. While the screen is black, processing time is accelerated by 30%.

Control F3 Disables the audible keyboard click when a key is pressed, pressing it again will re-enable the click sound.

Control F4 Toggles between International symbols and standard graphics symbols on the screen.

Control F5 This acts as the HELP key, since there isn't one on most IBM keyboards.
On all other machines 400/800's included, Control F6 acts as the Atari Inverse Video key, Control F7 is the BASIC macro select and Control F8 is the MAC65 macro select.
The last two keys (Control F7 & F8) control possibly the most interesting added feature of the new keyboard, it's the ability to send out an entire string of characters with but one signal keystroke (Macros). Built-in to TRANSKEY are two predefined tables of some commonly used commands for either BASIC or MAC65 Assembly languages. These are sent by pressing F1 - F8 and depending upon whether Control F7 or Control F8 was last pressed, will spit out either the BASIC macro or the MAC65 macro (Defaults to BASIC on power-up). Below is a list of the supplied macro commands.

MACROS

BASIC MAC/65

F1 LIST <CR> LIST <CR>
F2 RUN <CR> ASM,#-,#D:
F3 SAVE"D: SAVE#D:
F4 LOAD"D: LOAD#D:
F5 ?PEEK(FIND/
F6 POKE REP/
F7 Backup Backup
F8 ?FRE(0) <CR> SIZE <CR>

* F7 = SAVE"D:BACK" in Basic, "SAVE#D:BACK" in MAC/65

Note: <CR> stands for Carriage Return, commands with this as a suffix will be executed immediately. F7 is a way to easily save a back-up of whatever you are working on to disk (under the name 'BACK') with a single keystroke.
Function keys F9 - F12 (F11 & F12 available on Enhanced keyboards only) are used as option select keys.

F9 START
F10 SELECT
F11 OPTION
F12 HELP

The ALTERNATE (ALT) key will also function as the OPTION key and the SYSREQ key will also act as a HELP key (as well as Control F5).

OTHER SPECIAL KEYS

The key with the ($-) and (`) symbols on it (normally on the upper right corner) acts as an extra Escape key, thus placing it where most people are used to it being. Since these symbols are not directly available on the Atari, this key now has a practical use.
The key marked PRINT SCREEN (or Shift *) when pressed will output an unused character on the keyboard matrix (Dec #36, HEX $24). This in itself isn't very useful, but with a little ingenuity on the user's part, this key could be looked for and caused to activate a screen printing program. To see this key in action, you could type in: 10 ?PEEK(764):GOTO 10 <CR> RUN <CR> (or F2). This routine will continuously look for any keypressed and print out it's raw matrix keycode value.
The Control SCROLL key combination will actually be recognized as the Break key to the Atari computer (On most 84 key keyboards this key is also labled as break).
If Control, ALT and the NumPad DELETE key are pressed together, this will result in a System Reset to occur (assuming the Reset jumper wire was installed). Releasing the DELETE key 1st prior to Control and ALT, will usually result in a re-boot with Basic disabled. Releasing the ALT key 1st prior to DELETE, will result in a normal Reset with Basic enabled.
If you are using a BTC series keyboard, the extra key labeled MACRO will produce a simultaneous Shift Control action in combination with any other key pressed. Several programs recognize this as a send macro string function, of course on keyboards without this key, the normal Shift Control combination would be used instead.
Keys not utilized are: SCROLL LOCK and the combination PAUSE/BREAK key found only on Enhanced keyboards.

SOFTWARE COMPATABILITY

TRANSKEY is an external independent device, having it's own processor and memory, and by design is suppose to emulate a piece of hardware (a stock Atari okkeyboard). To the Atari computer, signals coming from TRANSKEY will be indistinguishable from signals that a stock keyboard would produce. This means that any software ever written wil be compatible with the TRANSKEY board, the only exceptions are as follows:
When a program such as a wordprocessor looks at keys in an entirely new light and essentially reassigns new meaning to these keys, there could be a conflict. An example would be where the extra symbols on the arrow keys no longer print to screen, but instead are used for moving the cursor to the next word, or the next line, ect.. Since these characters are on entirely different keys on the IBM standard, it will take some getting used to to make the same things occur in a program of this kind. For instance when running from MAC65's DDT menu, to increment or decrement the memory being viewed in the display window requires pressing either the (-) or (=) keys on the upper right of the keyboard. If you tried pressing the up-arrow or down-arrow instead (as the program instructions dictate) nothing will happen, at least not on the IBM keyboard. This way of doing things is rather rare, since most programs will recognize the keys in a

more standard fashion.
Another side effect of some of the word processing programs, is that many times they are designed to put the system in lower case when first booted up. Since there is no communication of this to the TRANSKEY board, the keyboards CapsLock light will indicate an upper case (or CapsLocked) condition (this is not the case when using a PC/XT keyboard see next section for details). This can usually be easily remedied by pushing the CAPSLOCK key twice which will reinitialize the computer to the keyboard and put the computer in upper case mode. This particular problem can also occur if the CAPS key is pressed on the stock Atari keyboard, but the same fix will also correct this problem.

KEYBOARDS TO USE

TRANSKEY was designed to be as flexible as possible and because of this, should be compatible with most any IBM PC/XT/AT or 3rd party equivalent keyboard. Best results will usually be obtained by selecting an 'AT' configured (or dipswitch configurable) keyboard instead of the auto-configuring types.

Configuring TRANSKEY to the keyboard is extremely easy, all that is required is to plug in the keyboard with the computer off and then simply switch the computer on. TRANSKEY will then perform an analysis of the keyboard attached and auto-configure itself to it. If you have a switchable PC/AT keyboard, be sure to set it's dipswitches to 'AT' mode. This will insure proper setting of the CapsLock light on power up. When using a PC/XT keyboard, TRANSKEY will initialize itself to lower case mode (although the computer will be in upper case, unless a boot-up program has changed the setting). The action of pressing CAPS LOCK would then place the computer positively in an upper case mode and indicate this condition by lighting the CapsLock light. Repeated pressing of this key and the indication of the CapsLock light, would then correspond to the actual case mode of the computer.
The reason for this difference between an 'AT' keyboard and a PC/XT keyboard, has to do with who controls the indicater lights. On an 'AT' keyboard the computer is solely responsible for activating or deactivating a given light, on a 3rd party XT keyboard it's the keyboard that controls the action of the lights (When powering-up it turns all the lights off). Since the Atari normally powers-up in upper case mode, TRANSKEY was designed not to alter this initial setting and if at all possible to reflect this by turning the keyboard CapsLock light on ('AT' keyboards). With a PC/XT keyboard you will still be in upper case mode from the computer's point of view, but the CapsLock light will be off. The state of this light after powering-up, will also act as a good indicater as to what type of keyboard you are using or in what way TRANSKEY has configured itself when used with an Auto configuring keyboard.

Thanks to everyone who replied to my request for information about the Transkey keyboard.

One person I spoke to told me that there's a problem with the Transkey board: if you type too quickly, characters are skipped or missed. The person who told me this doesn't actually own one of the boards, so this is simply hearsay. Does anyone out there actually own one of these boards? And if so, could you please tell me what problems you've had with it?

I received and installed a Happy 1050 enhancement board last week, and I'm really pleased with it. I know there's been a lot of chatter about using a PC to r/w Atari 8-bit disks, so many people should be interested in knowing that the Happy software includes a program that allows you to r/w PC disks ON YOUR 1050 (you need the Happy board though). The utility works extremely well, and I've been using it to transfer a lot of stuff (text and binaries). As an extra bonus, the board also speeds up disk accesses by a noticeable amount, and provides double-density. Oh-- it also lets you copy almost anything if you still haven't outgrown your piracy stage yet.

The Happy board costs about $110 US (including shipping), which is rather pricey. I have found it worthwhile, and I'm glad I invested in it.

Note: this is not intended to be any sort of advertisement for Happy Computers. In fact, I really think they should be shot for their refusal to release technical info about their 1050 enhancement. However, I thought that people should at least be made aware of the board's usefulness.

-Roy.

The latest issue of STart magazine (which now incorporates an 8bit section) has a fairly long review of the TRANSKEY that is written by Matt Ratcliff, so I tend to trust his judgement. He gave it a very positive review. He did say (and I quote) "The only flaw I discovered with the Transkey is the keyboard 'roll-over' feature; it's too sluggish. When typing on the PC keyboard and Transkey, I must slow my typing noticably, as compared to my average typing speed on an IBM PC system. This takes a minor bit of getting adjusted to, and will probably only be noticed by fast touch typist. It is still far more responsive than the original Atari 800XL keyboard."

He didn't explain what was meant by keyboard roll-over or if typing too fast caused you to loose letters. It does sound though like the average user would see a big improvement. I have a hard time getting much typing speed on my 800XL because the springs are so stiff. I am typing on it now and this message is starting to bother me.

Hope this helps. He did mention that with the cost of IBM compatible keyboards being so low, you can get set up for about $100. The Transkey is $48 for the solder in version and $58 for the plug in version. Don't spend the extra $10 unless you have a computer with sockets in it.

DAvid Shaeffer asks about fragmentation detectors and defragmentors for the ATari 8-bit hard drives.

Answer: Yes, there is a detector but no defragmentor as of yet. I am working on one, but it will be a few months still before I finish it. Also, it works for SpartaDOS only. You shouldn't be using DOS XE, and MyDOS simply isn't as good. (IMHO of course :)

Hello, die-hard 8-bitters!

Does anyone out there have any titling software which will run on an 800XL? I'd like to use my 8-bit to generate some snazzy graphic titles to jazz up my home video movies. I've done some simple things both in BASIC and in Ace C, but I'm sure someone out there has something much more interesting. I've also heard tell of commercial titling packages, but where I live no stores will stock 8-bit Atari titles, so I can't just walk out and buy one, either.

If you have such an animal, I'd appreciate hearing from you. Please email me at the address below. Thanks!

The program that you want is available from American Techna-Vision in
California. The program is from Datasoft and is called "Video Titleshop".

They are selling the program and 2 companion disks for $14.95 + $4 S&H.
They have a toll free order number (1-800-551-9995). Credit card use
is restricted to orders of $18.50 or more. Not sure if that includes
S&H or not. You could also have them ship it COD. You pay when it
is delivered, so someone has to be home during the day or you will have
go pick it up yourself somewhere. COD orders are cash only and that
adds another $3.30 to the cost. Still for a total for $21.80 you get
a program that originally sold for $39.95 if I remember correctly and
get two disk of whatever free with it.

Note: This is not an endorsement of the product since I have never used
it or seen it used. I do remember reading a favorable review a couple
or years ago. Anyone else actually used it?

Okay, I am posting this for a friend. He have the following for sale:

Atari Mega 2 System for sale

System include:

Atari Mega 2 ST (w/ 25 ft. keyboard extension and keybaord)
Atari SC1224 Color Monitor
ICD FAST style/case HD w/ 85 meg Seagate HD
Super Charger (w/ 1 meg RAM)
Replay 4 sound digitizer

Lots programs (both PD/Shareware/Commercial)

Total worth when new:~3000.00

Asking $2700.00 or best offer.

send mail to:

I have a friend who has an original Atari 400 with 16 K. I was wondering what the easiest way to get it to 48K would be. I have 64K worth of chips laying around from when I upgraded my 800XL to 256K, can I use them?

Thanks,

You could just buy a 48K upgrade board. Atari Corp. made a 48K
memory expansion for the 400 at one point. I saw it at B&C
Computervisions about a month ago for something like $15.

Here is the address and phone of B&C Computervisions:

B&C Computervisions
3257 Kifer Rd.
Santa Clara, CA 95051
(408) 749-1003

I upgraded my 400 so long ago that I don't remember what chips I used
or whether they are the same as used to upgrade the 800XL. However,
I would recommend that he not even start putting money into a 400,
assuming he still has the membrane keyboard on it. He will get tired
of it real fast and not get much use out of it unless he only uses it
to play games. He should consider buying a used machine if he wants
to upgrade. I was at the Chicago/Milwaukee Atarifest Sunday and saw
several 800, 800XL and 130XE's for sale in the 50 to 100 dollar range.
It is cheaper in the long run.

Howdy there,
Having recently moved, I have a closetful of stuff to clear out.
Up until the move, I used this equipment regularly, and it worked just fine.

For Sale:

1 - Atari 800XL w/256K upgrade $ 60

2 - Atari 1050 disk drives both with $160 ea
Happy upgrades (allows double
density, the ablility to back
up many programs, and to read
and write IBM disks from your
Atari!)

1 - Atari 850 interface (Atari SIO to $ 50
RS-232, and parallel ports)

1 - Atari 410 Program Recorder $ 10

1 - Atari 1200 baud modem (connects $ 60
either to the Atari SIO or to any
RS-232 port) fully Hayes compatible

1 - Atari 800XL computer (normal 64K $ 45
memory)

1 - MPP-1150 Interface (Atari serial $ 25
SIO to parallel port)

Numerous software, both games and applications comes free with a package
purchase. Includes Silent Service, Temple of Apshai, terminal emulation
programs, etc

Package price: $450

All prices subject to negotiation (in other words, they could go down). I
will be happy to accept the highest offer below my asking price.

Thanks,

Profanity is a feeble attempt to express oneself forcibly

Source record: 114633

I recommend the R-Link. The cost is $12, without case and cable (you must solder the cable). You can also order with a cable (for $20). Documentation includes instructions for wiring the cable, if you choose the 'no cable' option. I don't think either one comes with a case. No power supply is required. All baud rates are supported. The address is:

Viewpoint Associates
4753 Freestone Road
Liverpool, NY 13090

This is a great deal for an 8-bit 'R:' interface. They also sell one with a printer cable, for serial printers. BTW it is compatible with all popular terminal programs and a handler is enclosed with the interface, and some term programs (albeit old ones). Bobterm 1.2 works great with this interface.

3430. Re: Upgrading the RAM in an Atari 400

I believe that if you get some sortof carrier for theoriginal slots in
the 16K board for the
400 then you can upgrade the computer to 48K. I'm not too sure about the
internal spacing in the 400, it might be too cramped in there but
since the 400 is essentially the same computer chip compatibility
shouldn't be a question. Oh by the way you do need a new control chip
for the board. That shouldn't be too hard to find. Any surplus
eelectronics store should have some junked Atari 800s
that they can cannabalize. I might be wrong anout the chip though, you
might not need one at all.

The drive is the Indus GT. It's a great double-density drive. The
buttons were not all that nebulous, they let you temporarily
write-protect the drive, select what was displayed on the 2-digit
display, and force a density change. No, I don't want to sell mine.

Regarding upgrading the memory in an Atari 400... to upgrade to 32K, all you have to do is plug in a 32K memory card where the 16K card is..
(I've got one I could sell, if anyone's interested..)

Going to 48K is a little more complicated because there aren't enough address lines on the RAM card socket... the 48K card I installed in my 400 required soldering a little template pc board onto the bottom of the motherboard. It gets the missing address lines from the cartridge socket... installation was quick and painless...
(I'd sell the 48K memory board too, but I'd have to see about removing it and the template from the motherboard)

From: rrwood@contact.uucp
Message-ID: <1990Nov16.151126.19691@contact.uucp>
Source record: 114641

I'm trying to convince Sparta Dos to work with my Happy-enhanced 1050 (or is it the other way around?). I know it is possible to set the Happy 1050 in U.S. Doubler emulator mode, but it's a pain to have to boot with Warpspeed 7.0, set US emu, then reboot with Sparta. Ideally, I'd like to get a .COM file that sets US emu mode, and run it at startup.

I will gladly write such a program myself and post it if someone would be kind enough to provide the technical info regarding what SIO commands the Happy is expecting. Even better, if someone could provide me with the new address/phone for Happy computers, I will order the tech. manual and do it all myself (the phone number listed in my Happy docs connects me to a Dentist's office in California!).

And finally-- is there some sort of a public source of Sparta utility programs? And if there is, why aren't they also on atari.archive? And did the crash of Atari.archive affect the 8-bit software too?

ATARI 1040ST HARDWARE and SOFTWARE PACKAGE FOR SALE

piece-price
1040 ST with Joystick and internal $450
battery-backed-up clock
SC1224 Color Monitor $175
IB Drives external 5.25" 360K floppy drive $150
all cables, documentation and packaging included
----
total piece-price: $775
<><><>
Entire system price: $700

If you buy the entire system, I'll toss in, at no extra charge,
commercial programs including Wordprocessing, Drawing, Games
and "Printout" software -- I'll be happy to send details on
request. In addition, I also have about 50-60 3.5" 720K Floppies,
and something like 20 5.25" 360K floppies. Some are empty, some
filled with freeware and shareware. I'll include these too if
you buy the whole system.

I also have an Okidata Microline 92 printer with the Plug-and-Play
(IBM/EPSON-compatibility) ROM package and the High-speed Serial
Port Option -- either or both can be installed or not at your
choice. I'd like $100.00 for it, but that's negotiable too.

Please don't be too shy to email your offers for all or part
to me at 'gaz@apollo.hp.com'. Everything is negotiable.

Is there a reason you are posting it to this group? Most people on the net have some smattering of intelligence (otherwise they wouldn't be on the net, see?) so, if someone was looking to buy a used ST, where do you think they would look? In the 8bit group? Hardly. We are diehard 8-bitters here and most of us resent this type of intrusion. The only possible excuse for your posting this here is if you had finally given up on the ST and were looking on trading up to an 8-bit. If this is not the case, keep your ST's corralled where they belong - comp.sys.atari.st

A 64K machine? If it is important you can try the Unix cross-compiler
version which supports significantly more compiler memory.

It MIGHT be that one of the internal tables overran :-) :-)
The compiler's table of characters from string constants is particularly
tiny, like 256 bytes. The solution may be to break the program into
smaller .C files and link up the .OBJ's with LINK65.

There are quite a few SpartaDOS utilities on GEnie and I would imagine
on CompuServe too. The file name doesn't always give a good indication
that they work with SD. You will have to look at the long descriptions.
I have a lot of them on some PD disks that I got from our Users
Group but I can't get to them now. A couple that come to mine
are 'wedge' and 'wedge2'. There are many more.

Easy Charles, you'll make the fellow feel unwelcome. :-)

Actually, I probably would have done the same thing. Who better to offer
an ST to than present owners of Atari 8bit equipment? (it is considered
an upgrade by most people). I'm a die hard 8bitter too, but I'm sure
I'll move into the 16bit world one of these days, probably with an ST.
I don't consider it an intrusion, even though I'm not looking for an
ST now. If someone had posted a forsale message for an IBM PC, then
I would have been upset!

If you wanted a name and phone number for the R: Link, here it is:

John Demar
(Interface Source)
(315) 451-6470
4753 Freestone Road
Liverpool, NY 13090

Has anyone received their November ANTIC? They are offerring some bargains on back issues and back issues with disks. $99 buys a near complete collection of the magazine from '83 to '89, single issue w/disk for $7.00, 12 issues with disks for $49.95. They are also selling XEP 80's for $39.95! The phone number to call for that is 1-800-234-7001. You will need some sort of WP program for the XEP, though. It doesn't include one. It works fine in Basic and Bobterm, though. You must have a monochrome monitor to use it. I know of two word processors for it -- Atariwriter 80 and another by some small company.

3447. Re: Atari 800XL system for sale

Howdy again,
Here are the current best offers for this equipment. I will stop
taking offers on Wed the 20th of Nov. As you can see there are some pretty
low prices on some of this. Please let me know if you're interested, and
make me an offer. Best offer on Wednesday takes the item (or group).

For Sale: Wanted Current best offer

1 - Atari 800XL w/256K upgrade $ 60 $ 50

2 - Atari 1050 disk drives both with $160 ea 1 at $100
Happy upgrades (allows double 1 at $ 75
density, the ablility to back
up many programs, and to read
and write IBM disks from your
Atari!)

1 - Atari 850 interface (Atari SIO to $ 50 $ 35
RS-232, and parallel ports)

1 - Atari 410 Program Recorder $ 10
Note: my error. This is an
Atari 1010 Program Recorder,
not the older 410.

1 - Atari SX-212 1200 baud modem (connects $ 60 $ 25
either to the Atari SIO or to any
RS-232 port) fully Hayes compatible

1 - Atari 800XL computer (normal 64K $ 45 $ 45
memory) Note: The person who
made this offer has not yet sent
me payment or an address or in-
dicated a preference for method
of payment.

1 - MPP-1150 Interface (Atari serial $ 25
SIO to parallel port)

Numerous software, both games and applications comes free with a package
purchase. Includes Silent Service, Temple of Apshai, terminal emulation
programs, etc

Package price: $450 $350

All prices subject to negotiation (in other words, they could go down). I
will be happy to accept the highest offer below my asking price.

Thanks again,

Profanity is a feeble attempt to express oneself forcibly

A while back I posted the availability of my Atari 800 & disk drive &
cassette drive (!) & software for shipping plus a good reason for
wanting it. Now that Thanksgiving break (I'm in college) has rolled
around, it's time to actually send the thing (it had to wait until now
as it's sitting home in a closet in NJ, 350 miles from my college here
in Pittsburgh.)

The lucky recepient is:

Okay all you masterminds out there...I need a FAST, SMALL routine that converts a 3 byte binary number, into its 8byte ASCII equivalent.

I have a routine in DIRT.M65 that does this, but it is pretty slow (and pretty fast too compared to some of the ones I've seen). Feel free to take a look at it.

Anyway, the routine has to convert a 3 byte binary number to its 8 byte ATASCII equivalent. That is it. No other requirements. You don't have to remove leading zeroes, you don't have to right or left justify the number. Just give me a routine that goes from 3 bytes binary to 8 bytes ATASCII. Think you can do it? I checked about 8 different books, including a few non-6502 ones and they *ALL* did it in the exact same way unless the CPU had a built in divide instruction.
So, everyone, show me what a quack programmer I am and write me a faster routine. I'll even give you a whole 256 bytes to write it in (generous, aren't I? :).

No cheating now...supercomputers are not allowed to compete. What will you win for your super-duper amazing binary->ascii converter? Hey, honorable mention in the documentation of DIRT.

Thanks in advance
Charles Hughes

Here is a minor update for the DIRT.ARC file. I realized I had left a bit
of text out of the DOC file. Please substitute the following DIRT.DOC file
in DIRT.ARC if you distribute it.
-Thanks Chuck.

------------------cut here--
DIRT Version 1.0
Copyright 1990 Charles K. Hughes*

This is the version 1.0 release of DIRT - a new directory lister for
SpartaDOS. Though meant specifically for 4.0+ it will work with any
version of SpartaDOS except for 1.1.

DIRT will give a listing of files similar to the standard DIR command in
SpartaDOS, however, instead of giving the time a file was created, it gives
a listing of the attributes for that file.

Why use DIRT? Well, it is faster, shows the attributes, and is better
than the standard DIR command in two ways. The first way is with regard
to very large files - DIRT will show the full 8 bytes of file size (files
can be up to 16,000,000 bytes long) where the normal DIR command only shows
the lower 6 bytes of file size (any file greater than 999,999 bytes will
have the upper digits truncated). The second benefit is that DIRT can be
told to NOT display certain files, regardless of their attributes.

The standard form of the command is:

DIRT [+|-phasd] [!] [<drive><path><filename mask>]

The options are used as follows:

[+|-phasd] This option is used to specify the attributes of the files
you wish to see. If you start the option with a '+' then ONLY those
files that match the filename mask and have the attribute(s) specified
will be listed. If you start the option with a '-' then ALL the files
that match the filename mask EXCEPT those with the specified
attribute(s) set will be listed. This option must appear before the
path and filename. The letters refer to the following attributes:
p - protected, bit 0 of the status byte.
h - hidden, bit 1 of status byte.
a - archived, bit 2 of the status byte.
s - subdirectory, bit 5 of the status byte.
d - defragmented, bit 6 of the status byte. (see note at end)

[!] This is the NOT option and it tells DIRT to show only those files
that DO NOT match the filename mask. This option can be placed
anywhere on the command line, even inside the other options.

[Dx:] or [D:] This option selects the drive. If the Dx: format is used, x is the drive looked at. If the D: format is used then the default drive is looked at, EXCEPT under SDX.

[A-I:] or [1-9:] or [Da:] This option is valid only under SDX and is used instead of the drive options above.

Regardless of the option, the drive (if given) must end with a colon or the results will be unpredicatable. If no drive specifier is given then the default drive is used.

[pathname] The pathname must immediately follow the drive (if any). The pathname must be a valid pathname and end with a \, < or >. If no pathname is given then the current path is assumed. REMEMBER: Under SDX << and >> are not valid in a pathname.

[filename mask] The filename mask must immediately follow the pathname or the drive specifier if either is given. The mask can be any combination of wildcards and valid filename characters. If no filename mask is given, then *.* is assumed.

NOTE: There must be a space between 'DIRT' and any options in order for SpartaDOS to recognize the DIRT command. Likewise, there must be a space between the attribute option and the drive/pathname/mask option. The exclamation option can be placed anywhere and does not need to be set off by spaces.

The filename and options can be in upper, lower, or mixed case, DIRT doesn't care because it makes them all upper case before reading them. DIRT also ignores extra spaces between options EXCEPT there can be no spaces embedded in or between the drive, path, and filename.

The source code is included with this file. It is in MAC65 format and well commented (though not commented well :) so feel free to look through it. Anyone who wishes to modify it is free to do so but if you wish to distribute the modified version you can only do so under these conditions:
1) You must distribute the modified source code with the object code.
2) You must give proper credit (to me and previous authors if any).
3) You cannot sell the program though a small fee (less than $5) may be charged for copying & distribution. [Anyone who wishes to sell the program may contact me via the address below.]
4) You must include this same set of conditions in your distribution.

ADVANCED USERS NOTE:
The defragmentation bit doesn't officially exist but bit 6 of the status byte is unused by SpartaDOS so I decided that was the best way to keep track of a file that is not fragmented. This is of no particular value to DIRT, but is very important to the defragmentation program that I am working on. This bit is only valid as long as the file is not modified after being defragmented. In addition, SpartaDOS may zero this flag but is unlikely to set it.

If you feel this utility is something you could never live without, and have a burning desire to lighten your load and enrich the author,

please feel free to send some of that green stuff burning a hole in your pocket [plutonium is perfectly acceptable :)].

OK guys:
A) as to the Atari ST being posted in the 8bit board.....

I remember Tramiel buying Atari in '84 and all the old atari management
popping up at commodore, and I remember the designer of the ANTIC chip
creating a new and sophisticated chip for graphics and placing it in a new
computer called the amiga.....so which computer is REALLY the next generation
of atari....I don't consider the ST it....
So why post about stuff that doesn't even interface with the 8bit line
(except as a printer buffer) in theis base....

Oh, I now own an IBM.....

Ah the disk drive is the indus GT....great drive, but they went out of business
]just as the ST arrived I believe.....but did they ever come out with something
I believe was called the Ethernet?????

As to the DIRT program...3bit binary number stored in one byte??

if the number is in the last three bits, just

AND #$10
that shoulddo it....

>I believe was called the Ethernet?????

Uh, no.

Ethernet is a term describing networking hardware. Originally developed by
Xerox (???), it is now the de-facto standard in computer networking, at
least in educational and DoD computing sites. The majority of the networks
which make up the Internet are ethernet based. The network I am using to
enter this message is an ethernet network. Chances are, yours is ethernet, also.

If Indus came out with anything they called "ethernet" (which, if they did,
I never heard of it), they blatantly stole the name (unless, of course, Indus
made ethernet boards for 8-bit Ataris! ;-)

Perhaps you're thinking of something else, like Synchromesh (a feature of Indus
drives which sped up disk <-> computer SIO transfers by around 400%.

3458. Atari equip. for sale

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-21 19:27:23 UTC
From: davidd@csuf3b.CSUFresno.EDU
Message-ID: <1990Nov21.192723.20746@csuf3b.CSUFresno.EDU>
Source record: 114562

I have the following items for sale:

Atari 800XL computer. New $150, will sell for $50.

Atari 1050 5.25 floppy disk drive. New $175, will sell for $50.

Sakata 13" (diagonal) color monitor, NTSC video/audio inputs.
New $400, will sell for $125. (This monitor will work great with any computer
that has RCA video/audio outputs.)

Koala Pad and software (Koala/Atari interface) New $80, will
sell for $30.

Okidata color thermal printer (Okidata/Atari interface) New $220, will sell for
$50.

I will sell these items seperately, but would love to sell them as a package for
$280. I will ship via UPS ground in the continental US for free. I will accept
payment by Visa, MC, AMEX, Discover.

This computer setup makes a great first computer for a child. The koala pad and
software enable freehand graphics drawing in color, with easy to understand user
interface. Once color graphic has been drawn, it can be printed in color on the
Okidata printer.

If someone were to buy the entire setup, I will also ship with it about 50
floppy disks full of games, also including a word processor, data base, and
communications package.

Inquire by email to E DOUGLAS, or call (209) 896-2722, 10am-6pm PST, or (209)
897-7094, 6.30pm-9pm PST.

PLEASE DO NOT POST REPLY IN THIS FORUM. SEND EMAIL IF NOTHING ELSE.

Source record: 114564

> I think there was another item released around then that allows several
>8-bits to share disks, printer, etc. That might be what he was thinking of.

Several people have made reference to this.
A hardware add-on called the multiplexer provides this kind of functionality
to the Atari 8-bits. To quote their ad:

"This device brings the power and flexibility of larger systems to your 8-bit.
The multiplexer is a device (actually a colection of modules) that allow up to
8 Ataris to read and write to the same drive (typically a hard disk), printer,
and talk to each other. One 'master' compute (any 8-bit) is equipped with the
master multiplexer interface. Then up to 8 'slave' computers can hook up to
the master, each having their own slave interface. The 'common' peripherals
(things that are to be shared) are connected to the master computer. On each
slave, all disk and printer I/O is routed through the master, so no drives are
needed on them. The master computer can be configured in any manner you wish
- you can for example have certain peripherals 'local' to the slave, or
routed to a different number on the master. Under development is a BBS system
that will make full use of this device, allowing up to 8 lines/users to be
using the system at the same time! A multiuser chat mode is a feature of this
program, however, you do not NEED this program to run a BBS with the
multiplexer (but be warned that not all BBS programs will run concurrently).
All slaves are independent, and do not need to have the same program running
on them. This system is excellent for BBS SysOps, because you can be using
your hard disk(s) while still running your BBS uninterrupted! Another example
is a classroom situation, or anywhere a disk needs to be shared by different
people. This is an excellent programming/debugging tool as well! The
Multiplexer price is $199.95 for a master and two slave units (plus $5 S/H/I).
Additional slave units are $69.95 each. (716) 586-5545"

Many years ago MPP (I think) released a similar device which (I believe) was
called the Micro Connection. It only worked with DOS 2.5 and had some other
problems. I can dig up the review of it if anybody wants, but I'm not sure
it was ever even released to the public.

I don't know anybody who is using the Multiplexer, but it sounds like it
would be very good for running a BBS -- Bob Puff is writing the BBS software
that runs under it. He calls this program the Puff BBS.

BTW, the same company marketing the Multiplexer (CSS) also markets an SIO
'Y' connector with a switch, which allows you to manually switch peripherals
in/out. Many years ago Corvus systems released a multiplexer that would
allow up to 64 Ataris (with 9 multiplexers) to connect up to a single
drive. It only worked with 8oo's and required the standard joyport 3/4
interface for each Atari. Anybody on here use Corvus equipment on the 8-bit?
E-Mail me.

3461. "ST for sale!" ad in 8-bit msg area

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-22 02:45:06 UTC
From: Bryan_Jones_Woodworth@cup.portal.com
Message-ID: <36137@cup.portal.com>
Source record: 114565

I see nothing wrong with posting "ST for sale" messages in the 8bit section.
While I do not encourage it (all computers "for sale" should *logically*
(big smiley here! 8-D) be posted to the specific "computers for sale" area),
I do see the sense in posting a ST ad in the 8bit section.

As Ordania-DM@cup.portal.com pointed out very clearly, the ST is the logical
upgrade from the 8bit. This is why I agree that the ST ad should not be
blasted for appearing here.

>upgrade from the 8bit. This is why I agree that the ST ad should not be
>blasted for appearing here.

The ST is not the *logical* upgrade. The Amiga is. The smart upgrade
(for the average 8-bit user) is an IBM compatible (great value at a
great price with great support). The few remaining 8-bit users tend to be
die-hards, like the TI99, and ADAM groups are.

From: Ordania-DM@cup.portal.com
Message-ID: <36148@cup.portal.com>
Source record: 114567

Well, I've got some good news and some bad news...

First the bad news...there is one confirmed bug in DIRT.COM, located by yours truly. It isn't painful or nasty, so don't worry about it. Apparently DIRT.COM skips the very first directory entry - not a major bug but I should have a fix for it this weekend.
Anybody else find any bugs?

Ok, now the good news...I've figured out a way to convert a 3 byte binary number to an 8 byte ASCII decimal number. Not very impressive eh? Well, my way is fast and doesn't use any division. It does, unfortunately, require a 1200 byte table. I'm working on this method right now, so if it shows a significant improvement, I'll actually use it in DIRT 2.0. Also in DIRT 2.0, I will include the /M and /C switches (paged output and count files respectively), and perhaps even support for the erased, in use, and open for write bits.

Is anybody interested in a directory compactor? It would remove all the deleted & open for write files from a directory, and then deallocate any extra sectors the directory is using. Interested?

Suggestion: instead of /M, use /P, so that it is the same as
the rest of SDX (I don't know how 3.2d works with respect to this)

That's a nice idea!

Another idea that I wish someone would implement is a 'MOVE' command
on the CLI (not an interactive type thing, but something on the command line)
to move files from one directory to another by moving only the directory
entry. (Like COPY/DELETE, but much faster)

3466. Transkey Board

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-22 22:39:27 UTC
From: rrwood@contact.uucp
Message-ID: <1990Nov22.223927.9167@contact.uucp>
Source record: 114570

For those who are interested....

I installed a Transkey board in my 130XE, and am using it at this very moment to type ths message. It installed easily, and works quite nicely. (well, once I found a keyboard it liked :) Yes, there are problems with typing quickly, though it's inconsistent-- sometimes there are problems, sometimes not. I'd recommend it as is, and I'd definitely recommend it if the bug is worked out (there's an upgrade socket on the board, and it is set up with an EEPROM. Heck-- you could easily write your own OS for the Transkey board and fix the bug yourself.)

The docs are complete and easy to follow, and there are even instructions for burning your own EEPROM with different macros.

I'll end this rambling now.... Direct questions to comp.sys.atari.8bit, or to me.....

Oops. :) I didn't look in the SDX manual before typing, I would have
caught the mistake when I did the update. Any programs I create for
SpartaDOS will generally follow the SDX formats.

Off on a tangent... :) I wrote up the new routine for 3 byte binary to 8
byte ascii decimal and calculated the difference between the new routine
and the old. The new routine should be about 5 times as fast as the old one
take up about 3 times as much memory (100 bytes total - max :) but will
require a 650 byte table - this table will be generated dynamically rather
than being included in the code. This makes the DIRT command slower if it
doesn't find any files to display, but much faster if it displays even 1
file.

Me too...of course, that also happens to be another utility that I need for
the disk compactor, so you'll see it eventually.

I think I've found something: I have a directory 'MAC_65' which does
not work with DIRT. The '_' is legal with SDX, but the program thinks it's
bad input or something. I haven't noticed DIRT skipping the first directory
entry. Maybe I had an erased file in the first position, if that's what
it was.

> Me too...of course, that also happens to be another utility that I need for

There is a program that has MOVE command, it is the WEDGE program. The
program is either pd or shareware. It adds about 20 command to SpartaDos
including MOVE, which allows you to move just the directory entry. It also
adds quite a few other nice commands to the Sparta Command line, including
EDIT, PURGE, and RENDIR.

3470. SDX 'ATARIDOS.SYS' bugs/quirks

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-24 08:01:58 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <36196@cup.portal.com>
Source record: 114574

We've all heard vague reports of SpartaDOS X corrupting or deleting files, but I for one have never heard a CLEAR description of a distinct, repeatable problem.

However, I believe I have begun to characterize a misbehavior of SDX when used with disks in Atari DOS 2.0 format.

To wit, I find that SDX's ATARIDOS.SYS handler misunderstands file sizes as compared with "real" Atari DOS 2.0. SDX's "DIRS" command reports files as occupying ONE SECTOR MORE than Atari DOS 2.0 will list for the same files, and -- worse yet -- files CREATED in Atari DOS format under SDX get ONE FEWER than the right number of sectors recorded in their directory entry field.

This can lead, at the very least, to a great waste of disk space, not to mention the possibility of file corruption if sector usage and allocation information gets too far out of agreement with itself...

A friend and I have, however, managed to copy the programs from the SDX cartridge and put them on a disk where we can get a look at 'em. Perhaps we can figure out how the ATARIDOS.SYS driver works, how it hooks into SDX, and perhaps we or someone else can eventually FIX it!

(Which suggests that I'd better ask: have there been different releases of SDX? What's current, and how do I tell what I have?)

>However, I believe I have begun to characterize a misbehavior of SDX when
>used with disks in Atari DOS 2.0 format.

On the ICD BBS, there is a file called "ATARIDOS.SYS" which is
supposed to fix a bug in the SDX 4.20 ATARIDOS.SYS file. SDX 4.20 is the
current version of SpartaDOS X.

I would upload it here, except that there was a notice saying it
was not to be distributed.

ICD BBS: 1-815-968-2229

To find out what version you have, type "VERSION" at the prompt.
It also appears on boot.

Grumble, grumble, grumble. I checked this one out real quick the other day
and sure enough it is there. This is a simple bug to fix, but I really wish
I hadn't made such a stupid mistake in the first place. :(

Yep, but most people don't have removable harddrives, or a drive that they
can use just for this purpose. In addition, you can't just say
"copy D1:*.* D2:*.*" if D1 has any subdirectories; you need to use a program
for backing up the harddrive. Invariably, these programs require that you
put in a floppy disk, pull it out, put in another, ad infinitum. If you
don't want to make a backup, reformat the drive, and then restore the drive
(taking several hours of attended operation) you can use a compaction program
instead to clean up the harddrive.

Yes... but think of the advantage of loading 1 or 2k of directory, swaping around a few lines of information and writing it back out to disk. Beats the heck out of copying not only the directory entries, but all the associated data to another partition and back. (in terms of speed)

If you do it one directory ar a tine, the head won't even have to move more than one track on an optimized disk.

3478. Computer System for Sale

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-28 19:03:32 UTC
From: walk@mrcnext.cso.uiuc.edu
Message-ID: <1990Nov28.190332.28514@ux1.cso.uiuc.edu>
Source record: 114582

Atari Computer System for sale

Everything listed below is for sale by 12:00 (noon) Dec. 10.
Anyone interrested should place bids to walk@mrcnext.cso.uiuc.edu
(subject: atari)
I am also usually availible after 8pm by phone, 217-398-6380.

The minimum bid is $500 (This stuff really is worth more, but if this
is all I can get...)
For every bid you place, please give an email address, your actual address,
and a phone number with extention.
I will email you back notifing you that I have received your bid and if your
bid is the largest that I have received.

All equipment will be sold "as is" although everything except for the
things listed as inoperative worked the last time that I used them.

Pick up will be at either Champaign IL or Neoga IL (between Mattoon and
Effingham). If this is not all right with you, then please don't
place a bid. Also keep in mind that all the equipment will fill up a normal
sized trunk and most of your back seat.

After Dec. 10, I will email thank you notes to everyone who sent bids,
and I will then make pick up arragements with the person with the highest bid.

If I don't receive a bid of at least $500 by Dec. 10, I will post that I will
be will to sell pieces of the group.

Hardware

Atari 1025 printer, Atari 1020 printer, Atari 410 cassette recorder,
ICD P:R: Connection, assembled and working speech synthesiser w/spare parts,
Uninstalled Rambo XL, Atari 400 (16K), 1 Indus GT disk drive (3-4 months used),
1 reconditioned Indus GT disk drive (2-3 months used after reconditioning),
inoperative 800XL w/ Omnimon/FastchipXL installed, 5 Transformers,
2 sets of paddles, 1 computer to switchbox cable,
4 periphiral connection cables, 2 working Gemstick joysticks,
2 working Silkstik joysticks, 1 working Pointmaster joystick,
many non-working Atari joysticks

The Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST) Atari user group,
has a separate 8-bit meeting and 16-bit meeting.
We meet monthly, have special interest groups (SIGs), associated bulletin
boards, public domain libraries, and a newsletter "The Hard Copy".

I am on the executive of the group
so I should be able to handle most questions or
get replies from the rest of executive.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Rooms open at 7:00 pm. Meetings start at 7:30 pm.

Call 579-3695 for details.

Next Meetings
****
8-bit - Wednesday, Dec 5, 1990
MFCF Lounge, Room 3012 (3rd floor)

16-bit (ST) - Wednesday, Dec 12, 1990
DCS Course Room, Room 2009 (2nd floor)

Hope to see you there,
Dani Roloson

3480. New portfolio archive at atari.archive.umich.edu

Newsgroup: comp.sys.atari.8bit
Date: 1990-11-29 18:28:04 UTC

There is a new archive now in place at atari.archive.umich.edu for atari portfolio files. For those of you unaware what the portfolio is, it is atari's 1 pounder 'Palm top' that runs dos 2.0 with limited bios.

I have recently started a mailing list at swood@vela.acs.oakland.edu for atari portfolio users, and there was a demand for an ftp site, so here it is. You can find the portfolio directory via anonymous ftp to atari.archive.umich.edu (terminator.cc.umich.edu) in the atari directory. Seeing as how these files are ms-dos, and not atari format, there is also a symbolic link for the portfolio that can be found in the msdos directory.

Please send files, and please include an explanation of the source, use and and other helpful information with each of the files. Thanks and happy programming.

swood

3482. Pole Position cartridge wanted

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-02 14:32:01 UTC
From: kim@mathcs.emory.edu
Message-ID: <6599@emory.mathcs.emory.edu>
Source record: 114586

Help! I am looking for a copy of Atari`s Pole Position for the 800XL or the 130XE for my 7 year old son. I'd like to hear from anyone with a copy they would like to sell or who can point me to a commercial source.

As a possible incentive I have an unopened copy of ACE of ACES (WWII flying game) I would trade for Pole Position.

Thanks

Source record: 114587

I'm planning on uncrating my 1200XL when I go home for
Christmas, to set it up for my little sister.

Does anybody know where I can get any of the games in the
Carmen Sandiego series? I've never played them myself,
but my sister loves 'em.

Thanks...

3485. Carts wanted

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-03 04:10:40 UTC
From: rdw2030@venus.tamu.edu
Message-ID: <7605@lanl.gov>
Source record: 114588

I am looking to buy all the cartridges I can get my hands on. If you have a bunch that you want to get rid of, I would love to take them off your hands. I have an old Atari 400, and all I have for it are Pac-Man, Space Invaders, Missile Command, Centipede, BASIC, and the Assembler/Editor. I bought this machine back in '83 as a poor high school student and never did get all the great cartridges I wanted. Sure I'm a sentimental fool, but I sure loved playing Star Raiders among others.

Send me a list a name your price. The manuals for these would be greatly appreciated, as well as any additional "parts" that were included in the box. :-)

Also, I have a bad ROM in my 400. Anyone got a scrap set of ROMs? (OS ROMs)

Thanks.

3486. Bad 1050 Disk Drive

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-03 14:52:38 UTC
From: smisra@eos.ncsu.edu
Message-ID: <1990Dec3.145238.29737@ncsuvx.ncsu.edu>
Source record: 114590

I have a 1050 disk drive that works only intermittently...
sometimes when you have the cover closed...and the computer
tries to access the drive..the drive light becomes a dim
red instead of the bright red...and sort of fluctuates
and at the same time the drive makes a slow whirring noise
like it is trying to read a bad sector of the disk...
does any one know how to fix the problem and where I can
get spare parts for low price...I don't think the drive is
worth more than $25 in working condition...so I probably don't
want to spend more than that

I appreciate any helpful responses

thanks
Saurabh

This happened to my disk drive too. Upon disassembling it, I found that the band that drives the disk spindle (which appears to be some sort of cloth/rubber band) had gotten brittle over time and about 50% of it had actually gotten so hard that it had flaked off, leaving a large amount of blackish dusty particles strewn about the interior of the drive. After cleaning all this junk out, and refitting what was left of the band back into place, the drive still worked but on some cheaper/older diskettes (which I assume spin with more resistance within their jackets due to lack of lubrication or somesuch) the drive exhitibited exactly the same symptoms; a dim light, and a strained whir of the disk drive. My solution was to again open the drive and insert a small piece of folded paper on the door closing mechanism, so that the door wouldn't close all the way. My reason for this was that by not closing the door as far, the disk head wouldn't press so hard against the diskette, thus allowing slightly easier spinning of the drive with the reduced torque of the deteriorated band. The problem with this, of course, is increased errors in reading/writing, since the disk head is now not pressed so firmly and reliably against the magnetic medium. A tradeoff, but it seems the easiest solution. A better one would be to replace the band, but I don't know where you could obtain one.

>I appreciate any helpful responses

Hope this helps. I know that though my 1050 is old, I still don't want to junk it yet.

3488. Atari computer system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-04 04:04:18 UTC
From: walk@mrcnext.cso.uiuc.edu
Message-ID: <1990Dec4.040418.9487@ux1.cso.uiuc.edu>
Source record: 114593

Atari Computer System for sale

Everything listed below is for sale by 12:00 (noon) Dec. 10.
Anyone interrested should place bids to walk@mrcnext.cso.uiuc.edu
(subject: atari)
I am also usually availible after 8pm by phone, 217-398-6380.

The minimum bid is $500 (This stuff really is worth more, but if this
is all I can get...)
For every bid you place, please give an email address, your actual address,
and a phone number with extention.
I will email you back notifing you that I have received your bid and if your
bid is the largest that I have received.

All equipment will be sold "as is" although everything except for the
things listed as inoperative worked the last time that I used them.

Pick up will be at either Champaign IL or Neoga IL (between Mattoon and
Effingham) or you pay shipping. If this is not all right with you,
then please don't place a bid. Also keep in mind that all the equipment
will fill up a normal sized trunk and most of your back seat.

After Dec. 10, I will email thank you notes to everyone who sent bids,
and I will then make pick up arragements with the person with the highest bid.

If I don't receive a bid of at least $500 by Dec. 10, I will post that I will
be will to sell pieces of the group.

Hardware

Atari 1025 printer, Atari 1020 printer, Atari 410 cassette recorder,
ICD P:R: Connection, assembled and working speech synthesiser w/spare parts,
Uninstalled Rambo XL, Atari 400 (16K), 1 Indus GT disk drive (3-4 months used),
1 reconditioned Indus GT disk drive (2-3 months used after reconditioning),
inoperative 800XL w/ Omnimon/FastchipXL installed, 5 Transformers,
2 sets of paddles, 1 computer to switchbox cable,
4 periphiral connection cables, 2 working Gemstick joysticks,
2 working Silkstik joysticks, 1 working Pointmaster joystick,
many non-working Atari joysticks

My roommate has an 800, and has had it for 11 years. He has
wanted me to ask for help from the net for some time now.

His disk drive went on the bum, and he doesn't know what to do.
Where can he get it fixed/aligned. We called Atari, but they
don't care about the old machines; they are no help.

We live in the Detroit are, but are willing to ship it anywhere!

We use other computers for most things, nowadays, but there are
lots of REALLY fun things that we miss that are ONLY on the old,
best first and only, ATARI!

Thanks for any help! Please E-mail me for any responses to this. :-)

Call up Customer Service at Atari (sorry, I don't have the number) and
ask them what their current exchange rates are. The last time I checked
they were willing to take a 1027 printer and $75 and give you one of their
newer printers. They also did the same for broken 800xls, xes, etc.
I think they even do it for disk drives. In any case, give them a call
and ask about their exchange program. If they tell you that they have
no idea of what you are talking about, ask to speak to someone higher
up. They DID have this program, whether they still have it for the
8-bits (since they no longer manufacture them) or not, I don't know.

>

Try Happy Computers in Ca. I don't have a phone number or address,
but any 8-bit or ST magazine should have an add for one or more of
their products. They used to have a service where they would clean,
fix, and align 8-bit drives for something like $45.00. This will
likely have changed somewhat, but they are good at what they do. Your
drive comes back from them purring like a kitten!

Scott Ballew

```

Well, here we go again. It has been nine months since we released an issue of ZMAG. There has been numerous requests for 8-bit coverage in Z*Net Online, but the focus there is ST, TT, and STacy, to name a few. The coverage for 8-bitters is fading fast and during this year you have seen the departure of your favorite magazines. The hard copy coverage may be gone but we are here and look forward to providing you the best possible support.

This publication will start where we left off in December 1989 with issue #184. We will start with a bi-weekly format until November and attempt a weekly release soon after. Weekly release will be determined by the articles we receive from the readers and other sources. Already being selected as a source for material is the Puget Sound Atari News and the JACG newsletter. Since our sister hard copy publication is currently distributed in some twenty newsletters, I am sure we will be able to collect more articles in the months ahead.

Each issue will contain the latest Z*Net Newswire especially edited for 8-bit owners. Of course there will be other news appearing from time to time that we hope you will find interesting. In a survey to be released shortly, we will poll you for coverage requests. This will help us

focus attention on issues and news that interestes you.

There are a few people already volunteering efforts, and I look forward to pooling the information and presenting here. If you want to donate articles, please leave email on the services and the BBS. Regular columns will be assigned in the next few weeks and a special area each week for previously released tips and information will appear.

BBS systems carrying the publication are encouraged to leave a message with their number. The old Z*Magazine list has been deleted along with the system numbers previously assigned. The revised 1990 edition of the official ZMAG BBS list will be released as soon as we can get some numbers on it.

Stay tuned to this page in the weeks ahead on plans and feedback on suggestions. This new attempot will be a bit more personalized and contain the latest Atari happenings.

Thanks go to everyone posting the positive messages. Best of luck to us on this return and hopes for a long life online!

GLENDALE SHOW SETS UP SURPRISES

September 15 & 16 will bring the largest collection of Atari exhibitors ever to Glendale, California. The vendor list is firming up, and next week in Z*Net Online, we will have a new all-confirmed compilation of those who are coming. The Southern California Atari Computer Faire, Version 4.0b, is being managed by John King Tarpinian, who can be reached for last minute bookings or other information at (818) 246-7286.

Atari has let it be known that they have some very special things planned for this show, and even Elie Kenan, new General Manager at Atari, has taken part in coordinating the advertising for the show in major papers and on radio. Bob Brodie and many other Atari employees will be attending.

A first for any show will be a LYNX-LINK PLAYOFF, similar in concept to the Midi-Maze competitions that have been popular at many events. Prizes for those competing in the continuous multi-player LYNX games will include, of course, Lynx game units and lots of game carts.

Late word says that Portfolio developer Xetoerix will display a remarkable 20 meg hard drive for the palm size Portfolio computer.

New seminars being planned include a hands-on HOTZ MIDI TRANSLATOR session and a pair of PORTFOLIO "classes".

FREE TICKETS TO GLENDALE SHOW

John King Tarpinian is offering FREE tickets to the Glendale Atari Show. Regular admission will be $5.00 each day and only $3.00 for any Atari user group members with membership identification. In the interests of helping to support a wide mix and representation of Atari users from other states, John will also send up to 10 pairs of FREE tickets ($60.00 worth), to any requesting user group based outside of the Southern California area. Requests should come from a club officer and tickets are not for resale except to members for the benefit of the club treasury. Act soon to allow mailing time.

Remember, the show is this September 15 and 16. Call John at (818) 246-7286 at reasonable times. (Pacific Time)

ATARI STE FIXED

Sources close to Atari have let it be known that the hard drive operation problem in the Atari STe computers has been eradicated completely in the new production machines now leaving Sunnyvale.

Since no official statement has as yet been made by Atari regarding the resolution of the nastyu DMA problem, Z*NET has asked Bob Brodie to investigate and make an official response to our inquiry about it. We hope to have the last word on this and on the handling of exisiting machines very soon.

ST-WORLD SENT THE FRAUDULENT FAX

A joint statement is expected shortly from Atari Corp and former ST-World Magazine owner Richard Tsukiji, explaining that investigation of the "Bob Brodie FAX" incident has determined that the fax was in fact sent from the ST-World offices, but from persons unknown. The FAX in question falsely purported to be from Atari Manager of User Group Services, Bob Brodie, and urged a boycott of World of Atari shows.

ST-World Magazine offices were closed and Tsukiji was allegedly out of the state on July 2, 1990, when the FAX was sent.

Tsukiji is said to suspect that disgruntled former ST-World employees sent the damaging FAX. Tsukiji transferred ownership of the magazine to several employees for the sum of $1.00, bypassing other employees and editors who had expected to take over the ST publication.

LYNX OWNERS UPDATE

Are you tired of scanning through page after page of Nintendo stuff in video game magazines just so you can find a little Lynx news? Don't you wish there was... oh, I don't know..a newsletter that was devoted solely to Lynx news and game tips. Well now there is.

APE (Atari Portable Entertainment) is a quarterly newsletter that covers the Lynx exclusively. The June Premiere issue features Summer Consumer Electronics Show news, Lynx Game Secrets, tips and hints for California Games, Blue Lightning, Chip's Challenge, Electrocop, Gates of Zendocon, and Gauntlet 3.

The editor of APE is Clinton Smith. Smith is an avid Atari game player and has written several reviews for Atari Explorer and has some coming up in STart. If you're interested in subscribing now, (you'll receive the free Premiere issue automatically) send your Check or money order payable to Clinton Smith for $6.00 to:

APE SUBSCRIPTION
2104 NORTH KOSTNER
CHICAGO,IL 60639

INK CARTRIDGE REBATE

The Haystack Company we will be offering $7.00 for your dispensed Desk Jet Ink Cartridges. Just send them the empty cartridge, being very careful not to damage it, and they'll send you a check for $7.00 immediately.

The units are needed for testing. This is a limited time offer since they are only looking for a fixed amount. Depending on the response, the offer could expire at any time. However, they will guarentee the offer until September 23, 1990. Send to:

The Haystack Co.
215 West 88th St.
Room 8G
New York, N.Y. 10024

HP TOLL-FREE HOTLINE

Hewlett-Packard now has a US only toll free telephone number (1-800-233-5153) that customers can call to determine if their HP LaserJet IIP printer is one of approx 70,000 manufactured during the early months of the printer's release that have faulty power supplies. HP will replace the power supply of affected HP LaserJet IIP printers at no charge.

Customers in Canada should contact their local HP-authorized dealer or HP customer-service center. The failures do not represent a safety hazard but will result in a front control panel message "50 NEEDS SERVICE" that halts operation of the printer.

Owners of this printer purchased before March 1990 are encouraged to call the toll-free number. Customers who have printers with faulty power supplies will be given the option to:

- contact their local HP authorized dealer or HP customer-service center to have the power supply replaced free of charge

- return the printer to HP and receive a remanufactured printer with a full one-year warranty in exchange

GENIE OFFERS FLAT MONTHLY RATE

The GEnie online service announced last week the introduction of a flat subscription rate of just $4.95 (US) per month including unlimited, non-prime time access to more than 100 products and services.

The rate for US access to those GEnie service products/services not covered under the flat monthly rate has been set at just $6 per hour during non-prime time for all three access speeds of (300, 1200 and 2400 baud).

The prime time rate will remain at $18 per hour for all three access speeds. In Canada, the monthly subscription rate is $5.95 (Canadian), with a non-prime time rate of $8 (Canadian) per hour for all three access speeds.

The $29.95 sign up fee for the GEnie service also has been eliminated for all new subscribers effective immediately. If a subscriber does not like the new service, they can cancel their membership and the GEnie service will refund the $4.95 subscription fee to them.

NINTENDO UPDATE

Nintendo has launched 3 television commercials which showcase Nintendo's creative philosophy: having fun through game play transcends all ages. Incorporating real-life scenarios in all 3 commercials, Nintendo demonstrates how its Game Boy portable video game system can play a role in the lifestyles of two disparate age groups: kids and teens, ages 6-17; and adult males, ages 18-49.

* THE SOUTHERN CALIFORNIA ATARI COMPUTER FAIRE version 4.0b *
* ...also known as "THE GLENDALE SHOW" *
* *
* September 15 and 16, 1990, at the Glendale Civic Auditorium, *
* 1401 Verdugo Road, Glendale, California. Hours are 10 AM - *
* 6 PM Saturday, and 10 AM - 5 PM Sunday. Admission is $5.00, *
* or only $3.00 with any Atari User Group membership I.D. *
* * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * *
```

The Glendale Atari Faire is a User Group sponsored tradition in Southern California, the West Coast's Premier Atari event since 1986. This will be the fourth show in five years at the same large auditorium in Glendale, California, just a few minutes from Burbank Airport and convenient to all of the metropolitan Los Angeles area. An attendance of over 4,000 is realistically anticipated, considering previous year's performances. Last year's Glendale show was cancelled due to conflicting dates with another show, which was then itself cancelled.

With one month left before the show, organizer John King Tarpinian says that he is nearly sold out of the original floor space planned for use in the Glendale Civic Auditorium. He adds that if demand keeps up, convenient, quality additional space can be arranged. John says that the developers that appeared at the recent San Jose World of Atari show are booked for Glendale, plus lots more. Publicity for the Glendale

show, including the vendor list, has been low key until now to avoid drawing attention away from that San Jose show.

Here is the Glendale Show List of vendors, both of confirmed and unconfirmed "but likely" to attend. There are 45 of them so far, plus at least five user groups, making Glendale perhaps the biggest US Atari show of all time!

ATARI Corporation American Music
Best Electronics Bill Skurski Enterprises
Branch Always Software BRE

Sierra Seymour-Radix
SliccWare STart
ST Informer ST Journal
Sprokits Supra Corp.
Talon WuzTek
XETOERIX Zubair Interfaces
Z*Net News Service ... and more to come!

Atari Corporation has promised major support including a very large display of the entire Atari Computer line of products. You can expect to see LOTS of the ST, STE, MEGA, STACY, PORTFOLIO, LYNX, and even the TT030 computers. Many of Atari's employees will be on hand to show and discuss the machines. Advertising and promotion of this user-group show is being provided through the generousity of Atari.

User Groups will include HACKS, ACES, ACAOC, NOCCC, SBACE, BACE, and more. Volunteers from the groups will be providing the support for the entire show, including setup, loading and unloading, security, and staffing. They will also be available for short periods to assist vendors in their booths. All volunteers will be given a custom Canvas Tote Bag and Sun Visor (this is California!) with the Atari emblem on each. These are limited production and will be for volunteers only, NOT for sale! There will also be three $100 drawings, one each day of the effort, for volunteers only.

Many seminars are already booked, including several with ATARI's BOB BRODIE, other officials, and technical support people. Other seminars that are planned at this time:

* Desktop Publishing with CALAMUS - Nathan Potechin of ISD
* Software Speeding up the ST/TT - Darek Mihocka of BRA-SOFT
* Int. Assoc. of Atari Developers - Nathan Potechin, Chairperson
* INTRODUCING NEODESK 3 - Rick Flashman of Gribnif
* DAVE SMALL TALKS/MAC EMULATION - Dave Small of Gadgets by Small
* NEW FROM CODEHEAD - Charles F. Johnson of CodeHead Software
* Kids and Atari Computers -
* PC Emulation -
* ST Magazines and Online Newsletters -

...with more to be added and announced at the show.

Door prizes, including a wide variety of software, accessories, and computer paraphanalia, will be awarded every hour, with some extra special drawings as well.

Lodging information: The Burbank Hilton weekend rate is $59 per day. This hotel is adjacent to the Burbank/Glendale/Pasadena Airport, and will be where the Atari Corporation employees will be staying. Contact the Burbank Hilton at 818-843-6000. The Glendale Holiday Inn is the closest hotel to the show itself, and the weekend rate is $89 per day. Contact the Holiday Inn at 818-965-0202. These rates and hotels are neither endorsed or guaranteed by the organizers. Neither hotel is within walking distance to the Auditorium. This is Los Angeles, folks.. expect to use CARS. Don't worry about traffic jams in this area, however.

Directions to the show (once you have found Glendale, which is a Northern central suburb of Los Angeles): Take the Mountain exit of the "2" freeway and go West (down the hill) one block. Or, from the "134" freeway, take the Glendale Avenue exit, and go North one mile (Glendale Ave will become Verdugo Road). The Glendale Civic Auditorium, 1401 Verdugo Road, is on the NORTH side of Verdugo. Large parking lots are on the WEST side of the building, with metered parking for TEN CENTS AN HOUR.

The final booth sales, seminar schedule, and advertising space in the program are being arranged now. More information is available from the show organizer, John King Tarpinian, 818-246-7286, or by mail at 246 North Brand #321, Glendale, California, 91203.

|*| LABELS WITH DAISY-DOT III |*|
|*|||||||||||||||||||||||||||||||*|
```
by Roy Goldman

(This document assumes familiarity with the Daisy-Dot III near letter quality printing system. For information about DD3 send a SASE to Roy Goldman, 2440 S Jasmine, Denver, CO 80222)

COPY THIS FILE TO YOUR PRINTER (P:)

INTRODUCTION

One of the new features of Daisy-Dot III is variable page length support, which allows the program to keep track of pages regardless of page size, font or line spacing combination used.

The DD3 Print Processor Customizer restricts the minimum page length to 288/72" (4") to avoid possible problems caused by top/bottom margin overlap and printing of large fonts with large line spacing. Unfortunately, this restriction makes it difficult to effectively print popular continuous form 3 1/2" X 15/16" labels (with 1/16" between labels).

The following suggested modifications set the page length to 1" for proper control of these labels. But as a price for this flexibility, the user must become responsible for setting both the top and bottom margins to zero and making sure that font and line spacing sizes aren't too large when creating the labels. I recommend that you apply these modifications to a copy of DD3PP to be used ONLY for labels and that you continue to use a copy of DD3PP configured by the unmodified customizer for every other printing application.

MODIFICATIONS

Enter BASIC in your system, and type:

LOAD "Dn:PPCUSTOM.BAS"

where n is the drive containing an unmodified copy of the Print Processor Customizer.

You need modify only two lines, 6010 and 6020, so type:

LIST 6010,6020

Change the 288 in line 6010 to 72 and press [RETURN].

Change the 287 in line 6020 to 71, change the 98 in line 6020 to 70, and press [RETURN].

To double check the changes, type:

LIST 6010,6020

again. They should look like this:

```
6010 POSITION 2,17:? "Page Length (72-1008/72";CHR$(34);"):";:INPUT TEMP
6020 IF TEMP>71 AND TEMP<1009 AND TOP+BOT+70<TEMP AND TEMP=INT(TEMP)THEN
LENGTH=TEMP
```

Next, save the file under a different name. Try:

SAVE "Dn:PPCLABEL.BAS"

where n is the destination drive.

Next, run the customizer by typing:

RUN [RETURN]

Make sure you change the following settings on the customizer menu, in the order listed:

Enter T, 0, and [RETURN].
Enter B, 0, and [RETURN].
Enter N, 72, and [RETURN].
Enter W, 120, and [RETURN].

You might as well also change the left and right margins; I suggest setting both to zero (a zero setting will still provide the "built-in" 1/4" inch margins):

Enter E, 0, and [RETURN].
Enter R, 0, and [RETURN].

Next, press [L] and specify the location of the DD3PP file to be modified.

(Any other settings not specified above may be changed as desired.)

Finally, press [SPACE] to customize the program.

MAKING A LABEL

Here's a sample session for creating and printing several copies of an address label.

Run your word processor and type:

\cRoy Goldman [RETURN]
2440 South Jasmine [RETURN]
Denver, CO 80222 [RETURN]

Save the file as LABEL. Use this basic technique for every label--experiment to see how many lines of your favorite font will fit on a label. Almost every DD3 feature can be used within a label.

WARNING: Never modify the top or bottom margins.
WARNING: Make sure that the combined height of a font and the line spacing is always less than an inch (i.e. avoid quadruple height fonts and avoid large line spacing values).

Run the copy of DD3PP modified earlier. Specify MADRID as the font (after inserting the appropriate disk) and LABEL as the text file.

Insert the label form into your printer and press [START] to print. If the address isn't vertically aligned correctly within the label, change the alignment manually and try again. Continue this process until it is vertically centered within the label. Once the first one is okay, press C, 5, [RETURN], and [START] to print five more copies.

CONCLUSION

By following the suggestions in this document, DD3 can be used to easily

print labels.

In most cases, the page control feature is very accurate. However, with some fonts, there may be very small alignment discrepancies between labels that could become apparent if too many labels are printed at one time.

```
|*|||||||||||||||||||||||||||||*|
|*| 8-BIT PUBLIC DOMAIN UPDATE |*|
|*| by Ron Kovacs |*|
|*|||||||||||||||||||||||||||||*|
```

* GEM.ARC - Printer utility to setup your printer from DOS. Uses Sparta command line with parameter passing or a menu with less capable DOS's. Written in ACTION! with source for easy reconfiguring with other printers.

* APACSHW2.OBJ - Latest version of APACSHOW, the slide show program. This version works correctly with DOS 2.0/2.5, displays in an interlaced mode, (gets rid of those annoying black lines in APAC), and fixes a few other bugs.

* APACVW20.ARC - Latest version of APACVIEW decodes and displays GIF images in APAC (256 color) mode. It also allows you to create color-separations (.R, .G, .B) for viewing with COLRVIEW in 80 x 192 resolution with 4096 colors. This version also has some additional fixes noted in the doc file.

* SPLIB12.ARC - Sparta Library 1.2. Disk cataloger program. Runs under SpartaDOS only. Reads SpartaDOS, DOS 2.x, maybe MYDOS, disks. Features automatic subdirectory reads, describes and sorts by volume name, subdirectory name, file name and file description. Fixes bugs in version 1.1 and contains support files.

* VT52100.DCM - This file is an update to an early version vt52/vt100 terminal emulator. A bug in the old version that affected the backspace (and a few other keys) in half duplex mode only. This program is 100% machine language, offers a very complete emulation of a VT100 as well as VT52 terminal, and has xmodem and ascii file transfer capabilities.

* MFD35.DCM - This file must be expanded using Diskcomm 3.2 or higher to create the MFD 3.5 disk. Atari DOS 3 and XL/XE machine required. This is the newest version of the Master File Directory also known as the File Organizer. It includes all features of older version plus more, like the ability to delete unwanted records and new ways to search records. If you use any one of the older versions (1.5 or 2.0) you need, along with this file, the upgrade kit. New users only need this one. You MUST read the docs before using the program because it can't be used as it comes from the archive. Some setup is needed before using the program for the first time. Due to a minor quirk related to screen handling (which DOES NOT affect program operation) you should hold OPTION during boot-up even though the docs tell you

this isn't necessary. Not doing this may produce annoying garbage in the screen when you search records. This can also be fixed by re-starting the program by pressing RESET once it has booted. Documentation is NOT included in this archive.

* MFD35DOC.ARC - This file contains the docs for the new Master File Directory 3.5. If you use any of the older versions be sure to get the upgrade kit.

* UPGRADEKIT.ARC - This is intended only for users of the older versions of the Master File Directory also known as the File Organizer. This archive contains a program that will convert the data files you use with your older version to the format used in the new 3.5 version. Included are the docs to this program. You need to have Atari DOS 3 and XL/XE machine with at least 64K.

* PSDEMO.ARC - ARC file with PS icon fonts and a text file demonstrates how to incorporate Print Shop icons (converted with PSTODD3B) into documents to be printed with Daisy-Dot III. Included are 4 Icon fonts and a total of over 50 fonts (fancy alphabet, Atari icons, horoscope and Bart Simpson). The demo itself doesn't require PSTODD3B but does require the registered version of DD3. You will need PSTODD3 to make your own icon fonts. From DD3, choose ROMAN2 as the initial font and TEST.TXT as the text file. Make sure all other font files in ARC file (*.NL?) are on the default drive. Demo prepared by John McGowan from Columbia, MO.

* SLOGRO.ARC - A model of diffusion limited aggregation: a particle is released from the edge of a circle and wanders on a random walk until it hits a central dot and becomes "stuck" in place. This continues with additional particles until a "dust-ball" of accumualted dots fills the screen. This program is released by the author to demonstrate one of the educational disks available from Bresnik Software.

* BASICMOD.COM - Change BASIC rev. B to C; quiet the noise during disk access; speed key repeat; increase screen contrast; autoload a program in BASIC that is named "HELLO" [no extension]. This program loads into memory on page 6 and is protected against "RESET".

* THEPLAYR.ARC - The Music Player plays AMS I or AMS II tunes. If you have a 2nd pokey installed it will play in 16-bit stereo, 8-bit stereo, or 8-bit mono. Up to 69 files can be seen on the screen. Autoplay, Tag, Untag, and Play Tagged are some of the options. You can switch modes (16-bit S, 8-bit S, or 8-bit M) while a tune is playing. The name of the song being played is displayed on the piano screen. This is a GOOD AMS player. If you haven't done Chuck's Gumby upgrade yet, this should give you a reason to.

These files are available on the services and locals BBS systems.

```
|*|||||||||||||||||||||||||||||*|
|*| XF551 8-BIT HARDWARE MOD |*|
```

|*| A Project by Mike Stevens |*|
|*|||||||||||||||||||||||||||||||*|
(Reprinted from the Puget Sound Atari News, April 1990)

Well, I think I've found the ultimate disk drive for the 8-bit computer. I'm the AUGIE 8-bit Librarian and that means I handle a lot of disks which takes a lot of time and disk space. Since time is money, as the saying goes, I am always on the look out for anything that will save me some of either. Well, when I heard about the XF35 kit from Innovative Concepts, I was a little skeptical. But I thought, "If it works, boy, oh boy, will I have it made!"

The IC ad said, "Now XF551 owners can convert their drive to the newer 3.5" format and have a massive 720K of storage! Works with MYDOS, SpartaDOS, and the SpartaDOS X cartridge. Excellent for BBS use, hard drive backup, or use as a mini-hard drive!" The kit includes an upgrade ROM chip, adapting cables and complete instructions. The 3.5" drive was not part of the kit nor did I need it to be. Here in Southern California we have a lot of electronic swap meets and the one I went to for my 3.5 drive is the "General Dynamics HAM Radio swap meet". At this swap meet you can find almost anything in the area of electronics, computers and accessories. I found a seller who had three Cannon 3.5" DD-DS disk drives that he was willing to just about give away. So I gave him $10.00 for all three. One worked perfectly, another one wouldn't format every time but otherwise worked fine, the last one will be good for parts.

Anyway, after a phone call to IC, and a week's wait, I had my kit and all the rest of the parts I needed to install the new 3.5" drive in my XF551. Everything went in just like it was supposed to. I'm sure glad that IBM parts are all pretty much standardized. One change I would recommend, however, is not desoldering the cable connector from the printed circuit board. You're just asking for problems if you aren't really good at that sort of thing. Instead, just pry the top clip off of the connector and firmly press the new cable (the one in the kit) into place. Then put the clip back on the connector. It is really that simple.

The kit instructions gives you the option of either leaving your 5.25" drive mechanism in the case and installing the 3.5" drive externally, or replacing the 5.25" drive mechanism with the 3.5" drive by use of an adapter. I chose the internal option because I already own an AMDEC with four IBM type 5.25" DD-DS disk drives attached to it. In fact the XF551's drive mechanism is now number one on the AMDEC.

The instructions were clear and easy to follow. I really appreciate someone who takes the time to write good directions, since it makes all the difference in the world between a project like this being a pleasure or a nightmare. In this case I'll brag about these instructions and say that they make this Mod 'a piece of cake'.

Now to the good stuff: Using the modified XF551 or XF35 as it's called. I can't say enough about the practical aspects of this drive setup. After some experimentation I decided to use SpartaDOS and DiskCom together for my software. What I wanted to do was have the club's library available anytime without having to carry three or four hundred disks around with me all the time. As it worked out I've been able to put four to five double-sided 5.25" disks on each 3.5" disk. The combination of SpartaDOS and Disk Com means that I can read and duplicate in virtually any density or DOS situation I come across. I love it! I now only need to keep sixty or so 3.5" disks handy and they are little disks at that. I ask you, can it get any better? It's easier than carrying around a hard drive. Let's see .... 737K times 60 plus disks, ummm, well I'm sure it's more than 30 megs.

Another really great application for the XF35 is in telecommunications. SpartaDOS plus the Express 212 program handles the XF35 drive like a dream. I can up- or down-load huge files (compressed ARCed or text) with the greatest of ease. By the way, Text Pro 3.2r also loves the XF35. I haven't begun to scratch the surface of the potential applications for this wondrous modification. "XF35" where have you been all my 8-bit life? I just love it!

/// EDITORS DESK
----------------
by Ron Kovacs

Well, you can see that it has been awhile since the release of issue
#184. We have had a few problems relating to legal situations that are
yet to be resolved. For more information on the situation, please read
Issues #538-540 of Z*Net Online.

That situation is at a stand still until November. At that time we will
see what gets resolved. This matter did put a hold on my personal
participation and at the present time seems to be progressing in a
positive manner.

We are going to weekly releases effective with this issue. Each Sunday
evening/Monday evening, we will release material. It will be available
on the Z*Net BBS, GEnie and Compuserve and then on the Blank Page BBS
which, is the official 8-bit BBS for ZMagazine.

To support the 8-bit community, we need your help. Please write up
something and send it in. We can only search a limited area for
material and will be publishing reprints from user group newsletters.
If your 8-bit group is interested in publishing your material in ZMag,
send us a disk with your text files.

This weeks edition includes the latest Atari news, a WAACE show report,
reviews of BobTerm, Term80 and BBS Express! Professional. A new ZMag
feature will be included from time to time from our corrsepondents
Terry Schreiber in Canada and Jon Clarke in New Zealand.

We are slowly returning from our LONG vacation. Help us by spreading
the word we are back and send material when you can!

Thanks for reading!

/// Z*NET NEWSWIRE
------------------
```

START MAGAZINE ADDS Z*NET NEWSWIRE
Beginning with the December, 1990 issue, the popular Z*NET NewsWire will be presented within STart Magazine each month. STart's Tom Byron and Z*Net's Ron Kovacs recently signed contracts that make Z*NET the exclusive news column in the well known monthly ST specific glossy magazine. STart features the largest circulation of any domestic Atari magazine, and has recently added the subscribers of ANALOG and ST-LOG to their rolls. Z*Net will provide about three pages of news bits and news stories for each issue of STart. Says Tom Byron, Editor of STart, "Its a natural progression. Z*Net has the reputation and track record for solid news reporting." Z*Net Publisher Ron Kovacs adds, "This is a chance for Z*Net to reach a wider audience, beyond the modem users and user-group members who already get the Z*Net News Services." It is expected that the added recognition and credibility that the merger of efforts will bring to both publications, will further increase the quality and quantity of Atari news presented in all media ventures of STart and Z*Net. Z*Net is already a regular part of the news coverage of a number of magazines worldwide, including PD JOURNAL of Germany and soon ST USER of Great Britain. The Z*Net User Group Newsletter Supplement also goes to nearly 4,000 readers in the USA, Canada, Panama, New Zealand, Australia, and England.

STEREO COLOR MONITOR
Released to dealers this week was a new color monitor to compliment the STE's stereo sound. The SC1435 is the latest edition to Atari's ever growing line-up of computer products. With the release of the STE line's stereo sound capabilities it was a natural to follow it up with the SC1435. The monitor is not a re-structured SC1224 as was first thought but of a completely different design.

CANADIAN COMPUTER SHOW
The Canadian Computer Show, November 12th thru 15th, International Centre of Commerce, Toronto Ontario. Judging from last years attendance records of 30,000 plus this is definitely Canada's largest computer show. If you couldn't make it to Comdex then plan on trying to make it to this one. Atari will again be attending this great event held each year in Toronto. They will be displaying their full product line (including TT) with staff on-hand to answer your questions. Check it out - Booth 3530 Atari Canada.

BRODIE PASSES 1 YEAR
Z*Net congratulates our former Z*NET correspondent who has just passed his one-year anniversary at Atari Corporation. Bob Brodie, Manager of User Group Services since September 1989, went to Atari after being both a staff writer for Z*Net and President of ACAOC, the Orange County, California user group. He was also instrumental in the organization of the original Glendale Atari Shows. In a year, Bob has become the most sought after public speaker for Atari, and the most respected source of information about Atari. Thanks for everything, Bob!

FOSTER LEAVES ATARI
Frank Foster, formerly Atari's music division head, left the company

early in September. Frank came to Atari from HYBRID ARTS, a respected software development company that lead the way for early MIDI applications on the Atari. Although there is no official statement from Atari regarding his departure, it is believed to have been a mutual decision of Frank and Atari. It is known that Foster did not agree with some of the new policies of the new administration at Atari, and had recently failed to follow through on sales appearances and other commitments. Friends of Foster have said that he has moved on to a graphics company, a field Foster has had considerable experience and success in even while at Atari. His departure leaves Atari with no individual directly in charge of MIDI development and music industry support.

ADVANTAGE PACKAGE TO TRY AGAIN AT COMDEX
As Atari prepares for COMDEX, November's big Computer Marketplace of the World, the ATARI ADVANTAGE is being once again prepared for presentation. The Las Vegas, Nevada, show draws hundreds of thousands of people, and thousands of vendors to show their wares. Atari has said that they will have the TT READY FOR SHIPPING by the November show, and now, the focus is widening to cover the 520ST system (or possibly an STe?) bundled with an array of software for a blockbuster price. This time for SURE...?

COMPUTER SHOPPER DROPS ATARI
The editor of the largest computer magazine in the world, COMPUTER SHOPPER MAGAZINE, told his writers and contributors this week that his magazine will end its regular Atari coverage with the November, 1990, issue. Editor in Chief, Bob Lindstrom, said that it was a hard decision, and one that was just made in the last 30 days after considerable market and supplier research. Earlier rumors of their dropping Atari were neither based on fact nor were they an influence on the final decision. Computer Shopper is moving more and more towards being MS-DOS only, with Amiga and even MAC coverage under careful scrutiny now. Shopper will probably continue to run major stories covering Atari products when it is warranted, such as when major new hardware is introduced.

COMMODORE INTRODUCES THE C64 GAMES CONSOLE
Commodore's UK subsidiary has introduced the C64 Games System, a C64-based games console for Western European markets. The C64GS comes with a joystick and a port for cartridge-based software. Cartridges will include four games, a feature designed to give the C64GS a competitive advantage against other game-only computers. The product will be sold in European countries, including the UK, which has become a new center for C64 software developers.

SIERRA ON-LINE UPDATE
Sierra On-Line announced that it will assume European distribution rights to Sierra and Dynamix products on Oct. 1, 1990. Sierra will also distribute more than 12 new titles for the 1990 Christmas season, with the much anticipated King's Quest V, Space Quest IV, Quest for Glory II,

Oil's Well, Jones in the Fast Lane and updated versions of King's Quest and Mixed-Up Mother Goose. Dynamix, a Sierra subsidiary, will offer a mixture of products including Stellar 7, Red Baron, Rise of the Dragon and Heart of China.

/// 1990 WAACE ATARIFEST REPORT
---
by Jerry Cross

I want to begin by saying that the WAACE show was one of the best Atari Shows I have attended. And I have been involved in or attended a lot of them. One of the things I enjoy most about Atari shows is you can get a first look at many new products. This show had them in abundance.

Joppa Comptuer Products introduced "JuST the FAX!". This is a hardware/ software product that allows you to send FAX messages using 4800 baud, Group 3 FAX transmission. It also doubles as an excellent 2400 baud modem that will work with any communication program, such as FLASH. The software will allow you to convert IMG, Degas, and ASCII files into a FAX file for transmission. There are printer drivers to allow you to convert Pagestream and Calamus files to FAX, allowing you to produce your page and then FAX it to someone. The price for all of this is $169 suggest retail. It was sold at the show for $139. I did a few quick tests, and sent out a couple Pagestream pages to the FAX machine at work and it really works nice! There will be some upcoming upgrades that will allow both sending and receiving FAX messages at 9600 baud, and adds addtionals features to the modem. For more info contact Joppa at (301)679-4102.

Alpha Systems, had two new products. JamMaster is a powerful software program digital sampling synthesizer program loaded with features. It requires a cartridge based sound digitizer for output, such as Digisound Professional, and a MIDI compatible keyboard. You create your own sounds and assign them to your keyboard. You can have up to 32 different sounds and any number of octaves. Instead of using musical sounds, try some digitized voices or sound effects. It's great! Also introduced was an inexpensive clock card called Watchcart. This is a simple, bare bones cartridge that is just what I was looking for. I'm not sure what the retail price was (it wasn't in their flyer) but the show price was $12.

HiSoft was showing their line of products, including lattice C Version 5, and the new HARLEKIN program. Harlekin is a bunch of useful utilities rolled into one neat package. Just to name a few, there is a word processor, scrapbook, disk editor, terminal program, calendar, ascii table, RAMdisk, printer spooler...and on and on. It does require at least 1Mb of memory however. Hisoft is a British company, but I believe Michtron is a distributor of this product. (Sorry, I was reading my notes about this on the plane trip back, and it was too late to ask).

In the Gadgets by Small booth...well what can I say. All sorts of new toys over there! Spectre GCR was running on a TT. The 68030 was installed and strutting it's stuff. It was running next to a second ST running the same bouncing ball demo, at TWICE the speed! The 68030 upgrade is quite large, and will probably be offered as a Mega upgrade only, unless Dave can figure out a way to shrink it down. The Telsa coil was a real grin. Can't wait for that to go into mass production.

Sliccware introduced their new product SLICCTOP. WOW! This desktop replacement features multi-tasking, code swapping, process queuing, unlimited windows, data sharing, code sharing, dynamic memory, and too much other stuff to mention! Watch for a review of this product in the near future.

ICD introduced their new product, AdSpeed. This is an 68000 accelerator for all models of Atari ST's from the 520 through the STE. Using a multilayer, surface mount design, the chip is the side of the 68000 chip and will be no problem to install. Just unsolder the old chip, install a socket and install the AdSpeed. I ordered one at the show and will have more information once I can get it installed and play with it. The flyer gives the following features: No mouse, I/O or blitter conflicts, no jumper wires, software selectable true 68000 8 MHz mode for 100% compatibility (switches speeds on the fly without rebooting the computer), 32 kilobytes of high speed static RAM for 16k of data/ instruction cache and 16k of catche tag memory, full read and write-through caching for maximum speed, and supports 16 MHZ high speed ROM access.

Genie had a few surprises of their own. This month, Genie began their new price cutting rates. To help the user even more, they are introducing Aladin. This is a terminal program written by Tim Purvis of Michtron. You now have full featured program that lets you automate your online time by automatically capturing messages and download descriptions. You can then read and reply to messages while off line, and select files to download. The program will then automatically send your messages, and download the files. Full use of the GEM interface makes this program a must have for all Genie users. Best of all, it's FREE. It should be available for downloading sometime this week.

Add to all of these new products a number of upgrades for many other products, and this was a very enjoyable show. The exibition rooms featuring a number of topics were great also! I don't know how they lucked out and found a hotel that could fit in so many of these "classrooms" but I sure hope they can secure it for future WAACE shows.

But you didn't think I'd leave without complaining about something, did you? Will someone please explain the Dulles Toll road to me? You can travel from Dulles airport directly to Washington DC for free, but get off in the middle and you pay a toll? I smell a loophole in all of this!

/// TERM-80 REVIEW
==========

by Dennis Lukeman

Term-80 by Mark Gamber,
Rev.0.14(c)1988 Babarsoft, Inc.

Term-80, written by Mark Gamber, caught my eye, so I decided to try it, and here is my thoughts and observations:

The only feature worth mentioning as "fair", is that it's an 80 column term for the Atari. This is the main feature that convinced me to download and try it in the first place.

I rate it fair, simply because it's the best feature of the file. The screen was hard to understand until I fiddled with the brightness and contrast controls, but I was finally able to understand what was in front of me.

Another feature, which was really nice, but didn't impress me, was that the author's use of "windows" within the program, to help you fumble your way around.

The documentation that came with the term explained "The functions should be fairly self-explanatory if you've used any other terminal." The Documentation contained within the file was "semi" helpful, and could have been more detailed in spots.

A very disappointing part of the term was the up/download capabilities. I attempted both X and Y-modem downloads with no success. Downloads started out good, but after the buffer filled and was dumped to disk, the transfer aborted a few moments after the dump.

Uploading was no better, both protocols failed to handshake with several BBS's I attempted to send files to. Buffer up/downloads were no better.

The "autodial" list must be maintained by a seprate file that is run from basic, unlike other terms that can be edited, updated and saved while running the term. I found also that there were no provisions for storing "macros" for those finger-saving, auto logons.

Overall, I found Term-80 to be nothing more that an interesting toy, but having no other value as a term program. It's nice to see new software still being designed for the 8 bit, but here there were good intentions, but very disapointing results. Maybe later revisions will be more reliable.

/// BOBTERM 1.21 REVIEW
---
by Joel Kennedy
(Reprinted from the Puget Sound Atari News, September 1990)

Well guess what the friendly UPS man had for me on August 9th? Yep, SpartaDOS X and the R-Time 8 cart from ICD! SDX is great! I love it!!! The R-Time 8 is just as good (never again will I set the clock! right? Well, almost. The cart was sitting on top of my XE and fell a whole 2

1/2 inches. I now have a piece of foam stuffed inside the R-Time 8 to keep the battery in contact. Don't set the cart on top of your computer!). Ok, stop laughing and read about BobTerm 1.21 from Bob Puff.

When you first boot up BobTerm (to be refered to throughout this article as BT) you see a well done title screen. What I find most impressive about it is its rather accurate depiction of the states. Good job, Bob!

Next, you see the Main Menu. The options are pretty self explanatory, but I thought I would mention a few of them in more depth.

A -- You can change between ASCII, ATARI (aka ATASCII), VT-52E, and VT-52O. VT-52 is a terminal emulator, the 'E' and 'O' denoting even and odd parity respectively.

B -- Baud rates go clear up to 19.2k!!

D -- Well, it seems self explanatory but Bob added an embellishment. If you press START while you press 'D' you will be switched into "echoplex." This is primarily used when modeming between two individuals. One sets 'echoplex' on and the other stays in full duplex. Normally both would have to switch to half duplex, but echoplex will echo back the characters - just like a BBS.

F&G -- For when you are talking to someone (voice) and want to go to the computer mode (data) without redialing. Very handy!

R&S -- You can set both the transfer protocol, as well as the drive and path, for uploads and downloads. For Downloads BT automatically adjusts to the senders protocol. Also, for both uploads and downloads BT eliminates the need to pad a transfer block by switching to smaller blocks, and therefore lower protocols, if the rest of a file won't fit in the size block in use. For example: You are transferring a file that is 2,176 bytes long. You select 1k x-modem and two complete blocks of 1k are transfered. BT will then switch to standard x-modem for the remaining 128 bytes of data.

K -- basically a standard menu of DOS 2.x/MYDOS commands. If you'd loaded the CP.BTM (as a module), it will give you an interface directly into Sparta's command processor.

The lower menu commands are mainly used when you are in the Term mode. You can activate word wrap, reset the online time clock, switch between realtime/online time, do a screen dump, save a snapshot of the screen to the buffer and even activate fine scrolling. The chat window is an interesting feature, it allows you to pre-edit what you type before you send it. It only has a three line capacity but it is still handy. I don't use it much anymore because of the delay it causes. Everything that's in the buffer is sent when you press RETURN. Most people don't like you using it because they can't tell if you are typing something or just sitting there 'twiddlin your thumbs.'

When "J" is selected from the Main Menu three options will replace the lower menu. This submenu is pretty straight forward. By selecting the first option you will be able to see what the system macros have been set to. You can change your screen colors here as well as alter the macros. By choosing the third option the BOBTERM.CNF file will be written. This saves things other than just the macros and screen colors - so make sure you have everything set the way you want it.

Selecting "E" from the Main Menu will put you in the Autodialer Menu. The options are clear. Something of note though to you people with 'call waiting'. You can use the long distance code feature to disable your call waiting. See the docs for the 'how to.'

As I mentioned under the 'DOS functions' selection you can activate modules wich will add different features to BT. This are external modules which are loaded at bootup. Two are included, these are CP.BTM and XEP80.BTM. As I already said, CP.BTM gives you an interface to Sparta. XEP80.BTM is the driver for the XEP80 80 column card from Atari. I don't have this as yet, so I can't say how well it works, though I have been told that the one included in the version 1.20 arc file is buggy so make sure you get 1.21.

Well that's all fine and well on how to use it, but what does it feel like to use it? Well, I like BobTerm 1.21! I have only one complaint - you abort an operation by pressing START and begin one by pressing SELECT. This seems reverse to me. Otherwise, to quote Dan Knauf from his 'Black Box vs. MIO' article, "pretty is as pretty does."

BT is very nice and user friendly (except for the use of the START key). I've used it for the past couple of months and the only time I had any problems was when the handler wouldn't load from my 850 (I have to shut EVERYTHING off and try again if this happens, not just the 850 and the computer. If I even leave the disk drive on it won't work. Is there something wrong with my 850? If you know please tell me.) or when I attempted certain operations from the command line interface to Sparta. Outside from the above mentioned things I have had no problems whatsoever with BT and enjoy it very much.

///BBS EXPRESS! PROFESSIONAL

As I was preparing this review a persistent rumor of the sale of Express Professional was running through the Pro SysOps network. On September 12th, 1990 Keith Ledbetter's Orion Micro Systems announced it had "sold the rights to Bbs Express! Professional to Robert Klaas's K-Products company." "Keith still plans to keep upgrading the shell if K-Products asks him to, and we will still do our occasional new command for Pro."

****

Okay folks lets face it, not much has been happening with the Atari 8 bit computers in the past few years. Sure, there has been some great stuff released as PD/ShareWare from the few remaining die hard 8 bit programmers. A few cartridge programs and some hardware. In that time

period, my expanded XL has only seen 3 new items pass through it. All were purchased just to give the XL something to do other than take up closet space and the occasional word processing duty. Discovering the modem in 1987 opened a whole new world to me.

Logging onto the few local boards I saw the 8 bit programs available were outdated and in need of some major help. A local IBM SysOp used to always bust my cookies about getting a real computer and a faster modem. He invited me over his place one day to show off his system and to enlist my help. He wanted me to play assistant systems operator on his board taking care of the 8 bit Atari area. My instructions were to take all his files, arc them, send them back, answer Atari related questions etc. Loaning me a spare 1200 baud modem I was hooked!

Another SysOp then asked for the same thing and for my troubles he gave me an old 20 meg hard drive. With the drive in my possession I figured what the heck and purchased ICD's MIO and a controller. Telling my wife that it would be easier for her and the kids when using the computer. All that searching through piles and piles of diskettes for the one program they wanted could be eliminated. Everything, right here in this one little spot. Little did she know that things would go as far as they did. I had a secret desire to start my own board.

With two teenage children in the house a second phone line became a necessity. A line just for the kids (she fell for that one too). Doing a bit of research I decided to buy a new software package from Orion Micro Systems called BBS Express! Professional. On June 15th 1988 I set the system up on "our phone line" just for a test. That was the last time I was ever able to pull one over on her.

Requirements: Atari 800XL or XE, Hard drive recommended, SpartaDos 3.2, MIO, Black Box, 850, PRC and a Hayes compatible rs232 modem.

The BBS can be run on a floppy system IF you have several of them. The message bases alone take up tremendous amounts of space. You can configure them as you like but you're locked into a fixed size once the base is made. For example a typical base containing a maximum of 100 messages with a byte count of 1130 requires 156,160k of space. Once it's filled, new messages start kicking out the oldest ones making maintenance a snap. You can make smaller bases but if you are going to Network with another Pro bbs the netted bases should be at least the same byte size.

That's right, your bbs can call other Pro boards in the middle of the night and exchange messages with them. All without your intervention.

The standard system features up to 32 message bases, 32 file areas with descriptions, 32 command security levels, the ability to have over 1/2 million files available for download and much more. Notice I said standard system. A few of those die-hard programmers have pushed the system way beyond that limit. Right now my board size is at 180 megs and I can think of another half dozen that are bigger still. Hard to

believe the old workhorse can be pushed so far eh?

The software comes on 2 SD diskettes formatted both sides with all the necessary files to get you up and running. Each package is assigned its own unique Node number for Network identification and access to the support bbs. The supplied users manual is well put together and takes you one step at a time through setting everything up correctly. Even the novice should have no problems following it through.

The software supports normal ASCII text, ANSI (IBM) color, VT52 color, VT52 Mono and of course ATASCII graphics. Some boards are just now starting to put in IG graphics just for the ST'ers. If you haven't seen that yet it is a treat. Mouse support, moving graphics and sound all via the modem to the ST. That is just an idea of how flexible this software really is. Because of the memory limitations on the little Atari, Orion took a modular approach in its programming. That makes it simple to add or update the system. The core or shell operates like a policeman loading each module into memory as the user calls for it. Each one of these modules are actually programs in themselves and can be called from the the systems dosshell for ease of maintenance.

An event scheduler is included to handle up to 30 maintenance items. Some can be set to run after every call, one or more times a week etc. These events include purging the userlog, preparing packets for networking, system back ups, and of course overseeing the different online games that are available.

For the programmer you also get the system routines and equates so you can program your own files for the bbs in either Action or Assembly language. There are also cross assemblers available for the ST and MS-Dozers.

Don't get the idea that the software is just a toy, my friends bbs is gone. It seems his 286 machine couldn't compete with my little Atari and its high speed modem. Yeah, that's right I begged a 14.4k baud modem to reach out and touch someone (something about saving money on long distance charges).

Operating a BBS can be an expensive proposition. I figure the XL and the MIO worth maybe $150 dollars used. The hard drives and modem can always be put to use in another system when I'm ready to graduate to a "real computer". Why spend mega bucks on the latest, soon to be obsolete technology just to run a bbs?

To order Pro send $39.95 plus $4.00 S&H to: K-Products, P.O. Box 22122 A.M.F., Salt Lake City Utah, 04120. Include another ten spot if you want the networking modules too.

ShareWares

Ever tried to get the latest version of a shareware program? Now where is that address, I'm sorry, we don't take credit cards! A quick trot to the bank or post office to get that U.S. or Canadian money order or maybe not so quick. There are other problems involved as well but I'm sure you know most of them.

Commercial software houses have distributors so why not the small independents? Dammed good idea? I thought so, thus along with our retail store we are opening an area called Sharewares, a one stop clearing house for Atari ST shareware software. Shareware will be taken on consignment and offered for sale through outlets in Vancouver and Seattle via Visa or Mastercard with royalties paid on sales at the end of each month.

We are also planning on advertising in Club newsletters and magazines, this should help those Authors on a small budget to get some exposure.

For more information contact me at (604) 278-2099 during business hours.

Service Facility Expanding

Atari Canada's General Manager Geoff Earle announced today a one hundred thousand dollar expansion to Atari Canada's service area. This includes new equipment and more staff to handle the service and shipping of repaired equipment. "We realize there have been some problems with the service department in the past" said Geoff, "but with this expansion and an inter-departmental network online we hope to become one of the elite that is know for their service as well as their product lines".

Recent marketing studies done by Atari in Canada have found the consumer is not buying on price but after market service. Atari is taking steps at this time to bring their service up to standards which will equal or surpass most in the consumer market. This will also reflect on dealer orders with a faster turn around on parts and supplies.

Atari in Business

The Pacific Rim Computer and Communications Show is Western Canada's answer to Comdex. This is held in Vancouver every year this year falling on January 14th to 16th and attracts the who's who of the computer manufacturers. Atari has attended this show before in conjunction with dealers but this year there are a few changes.

Atari is serious about business applications and this show will be the first in a line of a new business campaign. Atari users have long known the positive aspects of the computer and now with the new "Atari TT" they have a more serious contender for this market.

In attendance will be Jimmy Hotz (Hotz Box), Nathan Potechin (ISD Marketing), Geoff Earle (Cdn General Manager), Denise Carrol (Marketing Coordinator), Murray Brown (Western Canada Sales and Marketing Manager) as well as Tim Breck and Paul Garay, two notables in the MIDI field.

The Atari area will be a show within a show featuring demonstrations on Desktop Publishing, Desktop Music, MIDI, Networking, Educational and Research, Word Processing and more. The entire line of products, Stacy, Portfolio, and MS-DOS line as well as the Emulators for display and demonstrations and of course, the 68000 and 68030 line.

EDITORS DESK
------------
by Ron Kovacs

Happy Halloween..... Hope you are ready for another winter, cold
temperatures, snow, ice and all those fun things we get ready for at
this time of year. I am looking at a yard full of leaves and get
sick thinking about all the work that has to be done. Just think, there
are only 7 weeks till Christmas....

News??? There isn't any worth reporting on. In our regular Z*Net
release two weeks ago, we reported on regular Atari happenings which
were not the most popular. As a matter of fact, that issue was the most
negative Atari issue I have ever published. Story after story left a
very bad taste.....like...Atari Taiwan Indicted for piracy, Atari's
Elie Kenan resigns and returns to Atari France, Apple takes in
revenues of 5.5 billion, and other news that would make you wonder why
Atari is still in business.

So, I searched through the ZMag Archives and found news items which
date back only to 1988. One of which was Neil Harris' resignation and
Sam Tramiels' very unpopular online conference. A year later, 1989, we
read again about promises not followed through and now in 1990, some of
us await more promises of glory. The 8-bit arena is dead, those that
choose to stay do so because of loyalty to ur machines. We run our
BBS's on them, use them for projects and play the games with them. I
occasionally sit down with my 8-bit and play and miss the day to day
applications I used to use.

I wonder where the 8-bit would be today if Atari were to have supported
it?? I know there are a handful of developers out there trying to
produce products for the machine, but it is really a sad affair that
the Atari ST/TT owners should take some time to review. It is slowly
```

happening all over again. The only question is how long does the ST have???

I do not want to drag you through the depression of Atari. The machines are decent and worthwhile owning. That alone is something to be happy about. Notice I didn't use the word "proud". I am not proud of Atari. I am disgusted that I am made to feel that I made a mistake purchasing all of the Atari products, from the Atari 800 through the MEGA series.

I will continue this commentary in the weeks ahead or when I have the time to sit and out my thoughts down. I welcome others comments on the past or future and would like to see some continuing dialog take place here. If you have something to add, please pass it along.

I want to also thank the few who have sent me letters. It is encouraging to read some mail that is positive about Z*Mag. I have taken some of the comments seriously and re-focused the contents and will continue to do so. So please keep the comments coming.

This week we welcome Stan Lowell to the staff as Contributing Editor. I have more comments on this at the start of Stan's column. Welcome and thanks for the support!!!!

So, on we go with Issue #186. Imagine... 186 issues of ZMagazine out there.... Sheesh!!! This publication is older then my children!

RUMBLES...RAMBLES...RUMORS...
==========
by Stan Lowell

Ever hear "There's nothing new for eight bits?" Maybe not mountains, but new hardware and software are still kicking! Refinements are being made to what is out already too! Not on as grandiose a scale as in the heydays of course, but they are out there!

The biggest problem as I see it: communications. Spreading the word around. I have seen messages from people who know NOTHING of ICD, SpartaDos, the Black Box, and on and on. These were not posted by new comers to the Atari arena, these were from people who have been using their machines for a few years! We still have the Antic "insert" in STart Magazine, but that is the last commercial stateside resource left.

This on-line magazine, ZM/A\gazine, is a good source. Where does ZMag get its material? From user groups and readers who submit articles, reviews, letters, or just information to it. In short, YOU the readers, help to support it.

There are other resources around. User Groups are a VERY GOOD resource for both problems you may be having and for information about new things which may be "out and around" someplace.

Bulletin Board Systems(BBS) are another good resource for information and help. Many ST Bulletin Boards feature message networking to some degree. Even 8-bit Bulletin Boards have message networking. My BBS,

FoReM-XE Professional, has had it for well over a year. Express Pro!, Carina][, and I believe Puff BBS have message networking.

Networked messages are a fantastic way to find out about new things, get help with problems, answers to questions, or just have a good conversation. Most of you probably know about a BBS. Otherwise, you wouldn't be reading this! <Grin> If you don't, then you are missing one heck of a good time! Get a modem, get a terminal program, and jump on-line!

Most new commercial software for the eight bit Ataris comes from overseas. I have heard of a place or two in the UK which will mail order to the U.S. Don't know of any stateside places which carry any kind of inventory for us 'old timers.' If you know of some, let me know!

Public Domain and Shareware programs are still alive and well. New revisions are out for TextPro and DaisyDot3. John McGowan in Saint Louis, Mo. has written several programs which will let you print icons in your text using DD3. New Versions of Snapshot are out. Snapshot allows you to have 2 different programs in an expanded XL or XE and switch between them. There is a version for hard disk owners which allows for up to ten programs on your hard disk. SUPPORT SHAREWARE!

On the hardware side, TransKey has been out for some time. TransKey allows you to hook up a standard PC type keyboard to your XL/XE, and includes keyboard macros! From all reports I have seen, it is an excellent product. The prolific support given by CSS' Bob Puff continues. Rumored to be in the works is a chip for an XF551 which will allow both the 5-1/4 and 3-1/2 drives to be on-line at the same time! Also coming is a controller for the Black Box which will allow reading, writing, and formating of PC, ST, and 8-bit formats!

WEll, that's about it for now. As I find out about, or remember new "things," I will pass them on in a future article. If you know of, or use a product or program, let me know about it. I can be reached on the Z*Net BBS, GEnie(S.Lowell), or on my BBS(Blank Page BBS - 908-805-3967, 3/12/2400). 'Til next time...

Editors Note: Stan Lowell is a long time friend and supporter of Z*Magazine. His guidance in the early days helped Z*Mag stay on course during rough times. Stan has also been a support sysop for Z*Magazine BBS systems during the past 5 years and his assistance with the new Z*Mag is greatly appreciated. Please leave Stan a message and encourage him to continue writing!!

PRINTER BASICS - PART ONE
==========
by John Picken

Everything You Wanted To Know About Using Your Printer!
(Reprinted from the Puget Sound Atari News, October 1990)

Many computer owners claim the "raison d'etre" for their system is productivity software - data base, word processor, etc. At least, that's how they justify the time and money spent to a disbelieving spouse; after all, Rule 1 of personal computing is: "Never admit to owning a joystick".

Assuming the owner is actually going to use the system for more than PacMan, the most important component becomes the printer. Application software is nearly worthless without a means of presenting permanent results. Unfortunately, the printer is often the most underutilized component in a system because it is the least understood.

Using a printer is not terribly complex though it sometimes seems so because of the instruction manual. Usually, all the information you need to learn to control any printer can be found in its manual, albeit with some errors. You often get better results by regarding the manual as a collection of hints to provide a basis for experimentation. Why this is so is anyone's guess, but you can add this to the collected wisdom of Murphy: "Quality of documentation varies inversely with printer sophistication."

Printers come in all shapes, sizes, and prices. They may be broadly categorized by the way they mark the paper. Laser machines produce superb results at a superb price. It is my understanding that they print using techniques similar to Xerography but I haven't really looked into them because of lack of opportunity (read "lack of dollars") to play with one.

"Letter Quality" printers produce characters by the single impact of a complete form, whether it be on a wheel, drum, ball or typewriter key. This category runs from top of the line "Daisy Wheel" machines down to the old Atari 1027. Prices range from high to low and, correspondingly, speeds from fast to dead slow. All however, have two common characteristics: First, if character size and style is changeable, it can only be accomplished by replacing the printing element. Second, they are mechanically complex and usually noisy.

"Dot Matrix", the most commonly used printers, produce images by patterns of dots similar to the way an image is drawn on a television. Dots may be formed by ink jets or thermal paper but most commonly, are produced by "pins" striking a ribbon over the paper. "Nine-Pin" dot matrix machines are the subject of this discussion.

While it is possible to find older models with fewer, the standard is nine pins, though only eight are normally used at any one time. The pins, also called "wires", are arranged in a vertical column. Images are produced by moving this column across the page while "firing" or "striking" the pins in various combinations. The difference from a television is that the printer does up to nine rows of pins at a time.

Why use only eight of nine, and why these numbers in the first place? Well, eight is the closest thing you will find to a "magic number" in the world of computing because a "byte", which is normally the smallest

usable amount of data, is always made up of eight bits. The printer is able to interpret the bits separately, so the bits of a single byte can be used to control firing of eight pins.

The ninth pin is there for things like underlining or descenders on lower case letters. The printer normally only uses eight pins but it may switch between the top or bottom eight. Try underlining on most printers and you'll notice that the underline runs into lower case descenders. There are nine-pin graphics modes but they are rarely used as a complete second data byte is required for the addition of only one more pin. Essentially, you can ignore the existence of the ninth pin unless you want to get into more advanced subjects like download characters.

"27-Pin", also called "24-Pin", printers are nearly identical, but have three such pin columns mounted closely side by side with a slight vertical offset between each. This arrangement produces much higher quality characters than is possible with nine pins. Once you get beyond simple text printing, these become more complex as you obviously need at least one byte to control eight of the pins in each of the three columns and the equivalent of the nine-pin mode would require a total of six data bytes.

The key to understanding how dot matrix printers work, and therefore, what is and is not possible, lies in the name. They cannot produce any image other than a "Dot" - everything they print is formed from dots. The "Matrix" part of the name describes something which, physically, does not exist. It is a human concept represented by a collection of bytes in the printer's memory. The printer's "Firmware" (program in ROM) interprets these as a pattern of pins to fire to form a particular character. Mechanically, that's it: the printer can produce only dots. Firmware and software control pin firing, paper feed, and carriage motion to arrange these on the paper.

While printer response to any particular byte is governed by firmware, this response can be modified. Sometimes this can be done by switches but many features are not controllable except by software. In other words, the computer must command the printer remotely.

Like any other kind of remote control, communication is required. A small part of this consists of actual electronic signals. Most, however, is exercised by the computer talking to the printer in a language it understands: patterns or sequences of data bytes. This is where the user enters the picture via a word processor or other program.

Getting what you want out of your system requires you to give both the printer and the word processor the proper commands. The word processor contains a block of data holding the information it needs to control your particular printer. This is changeable, normally by load from disk. There are numerous names used to describe these: "Printer Driver", "Printer Description", and "Configuration" files being some of the more common. No matter what they're called, they are functionally

bilingual dictionaries which the word processor uses to translate something like "underline from here to there" into language the printer understands.

If your system is not producing up to its capabilities, the source of the problem may very well be this file. Most word processors come with a utility program to allow you to change or customize the printer driver. The catch is you've got to read and understand the documentation, both for the word processor and the printer, and you have to know what is and is not possible. Understanding of a few terms and measurements aids in this task.

BUFFER

"Buffer" is commonly used but not always understood. A buffer is just a reserved area of memory for temporary storage of bytes. When dealing with printers, there are at least two buffers involved, one in the computer and one in the printer. Eight-bitters have a buffer in the interface as well which serves the same purposes as printer buffers.

Buffers allow transmission of multiple byte blocks of data. This decreases time lost on "Handshaking" signals and calculation of checksums. Also, since the printer can't print anywhere near as fast as the computer can send, it accepts and stores as many bytes as it can so that the computer is free to move on to other business sooner. Obviously the bigger the printer buffer, the sooner the transmission is completed.

The second purpose of the printer (and interface) buffer is to allow it to examine and modify the data before it is printed. It has to sort out printable data from commands, make any required conversions such as ATASCII to ASCII or addition of auto linefeeds, and possibly, calculate right justification, etc. Once this is done, it determines how, and at what point in the printout, to apply the commands.

Most printers actually have two buffers - everything that comes in goes to the "Receive Buffer". Printable stuff is then moved and held in the "Print Buffer". The importance of this distinction is that some commands affect only the print buffer - you have to read and decipher the book.

Part Two of the article will appear in Issue #187.

NORTH CENTRAL REGION EDUCATIONAL
LABORATORY'S TECH EXPO 1990 REPORT
==================================
by Mike Brown

One of the things that we, as Atari owners, are told should be done to assure the survival of Atari computers in the US, is to get Atari computers into the schools. Recently, I was invited to attend and participate in a very large educational "Tech Expo" sponsored by the North Central Regional Educational Laboratory, The Urban Education

Network, The Office of Educational Research and Improvement (US Department of Education), Chicago Public Schools, and Illinois Institute of Technology.

This show and conference was attended by representatives of the 13 largest urban school districts in the Midwest along with the State Departments of Education for the states of Illinois, Indiana, Iowa, Michigan, Minnesota, Ohio and Wisconsin. Doesn't this sound like a crowd that should be exposed to "Power without the price"?

My ticket into this exclusive gathering of educators and school system policy makers was my volunteer work with a Chicago Public Schools funded project to develop a "...conference conduit for users of all ages and background with any type of computer to share ideas. (the system) will erase the boundaries between schools and the greater community and provide support for classroom teachers...". If you guessed that this sounds like a multi-line BBS system, you win the star prize! Our BBS system currently has eight concurrent lines (with multichannel CHAT capability) on a UNIX minicomputer provided by Unisys. The system (which has just celebrated it's first birthday) is called the EIES (Electronic Information Exchange System) of the Chicago Public Schools. Give us a try at (312) 890-8512 1200/2400 and (312) 890-7828 9600. Visitors welcome!

NCREL asked me if I'd be available the opening day of the show to staff a booth with other technical volunteers, I offered (sneakily) to work Saturday if I could use equipment and software that I was already familiar with. The organizers said "no problem, you can bring in what you want to demo the system on". A neighbor, good friend, and LCACE guiding light, Dwight (J.J.) Johnson volunteered his new STacy for use at the show, this would be the hot show setup in a world of dull MS-DOS and Apple systems.

The gleaming new STacy was the star of the EIES booth- I drew a large number of comments from attendees about the STacy, and made some contacts with educators who use 8-bit Atari systems (most notably with LOGO) in classroom situations. A group of students (helping in the huge 5000 sq ft Apple "School of the Future" exhibit) stopped by to play with the STacy and had very favorable comments. Near the end of the day, the EIES sysop regretted the fact that I had chosen to set up so near the aisle, as the STacy could have drawn people "into" the booth (yes, but it was more visible at the end!).

At the show, I was surprised by the large outlay that IBM and Apple Computer made in equipment, staff, hospitality and outside exhibitors. Their presentations were easily as elaborate as what you might see at a COMDEX show. Zenith, Tandy and Pioneer America had more modest (but interesting) booths. While developers such as Advanced Voice Technologies, Inc., Computer Curriculum Corporation, The ERIC Clearinghouse on Urban Education, Ed Tech, Encyclopedia Britannica, and TI-IN Network each had "one table" booths swarming with interested educators. Over 60 different sessions were presented during the 3-day

conference. These sessions were held by exhibitors, software vendors, as well as educators themselves. There were ongoing sessions in the Faculty Club room sponsored by Apple, and IBM had constructed a "Decision Support Center" to privately hawk their multimedia products.

It was a very revealing experience shmoozing with educators and administrators, soft pedaling the Atari Advantage. One of the more frightening revelations of the conference, was the stranglehold that Apple Computer has on the US educational market, and the mind set of the educators. I constantly heard educators referring to computer labs as "Apple Labs". This seemed to make as much sense as calling Driver's Ed, "Chevrolet Training" or Home Economics, "Kraft Class". Before I was even in the show proper, an educator asked me "Is this the place where the Apple Expo is?"; my reply is not suited for a publication read by young persons, so it will remain unreported.

Anyway, thank you to Carole S. Fine, Dennis Tokoph, NCREL, and all of the others that made it possible for STacy and Myself to play a small part in the shaping of solutions to educational problems in urban schools.

For more information on future Tech Expos, or general information on High-Tech, High-Touch and High-Teach resources for your local schools, please contact NCREL at 295 Emroy Avenue, Elmhurst, IL 60126 (708) 941-7677.

Z*NET NEWSWIRE

SECOND "SIMPSONS" GAME
Acclaim announced this week that it will release its "Bartman: Avenger of Evil" hand-held in November. Under an exclusive licensing agreement with 20th Century Fox Licensing & Merchandising Corporation, Acclaim is publishing Nintendo Entertainment System and Game Boy video games as well as SuperPlay hand-helds based on the "Simpsons". "Bartman: Avenger of Evil" is expected to retail for approximately $19.95.

ATARI 8-BIT SURVEY

Courtesy GEnie Atari 8-Bit Roundtable

DataQue Software is currently developing a C programming language for Atari 8-bit computer systems. Your input on the following questions will allow us to shape the product to your needs. You may also ask any specific questions you may have in the Atari 8-bit BB area on GEnie, Category-3, Topic-15. Of course email to DataQue.1 is also accepted.

There are 25 total questions in this survey. Some questions require one answer, others allow multiple answers. You will have a chance to send comments following the survey.

1. What is the main programming language you use (if any) ?

A. Atari BASIC B. Turbo-BASIC XL C. BASIC XE, or XL
D. Pascal E. C F. Forth
G. Action! H. Assembly/Machine Language
I. Another language not listed above
J. I do not program at all currently

2. If there is another programming language you also use often, what is it?

A. Atari BASIC B. Turbo-BASIC XL C. BASIC XE, or XL
D. Pascal E. C F. Forth
G. Action! H. Assembly/Machine Language
I. Another language not listed above
J. I program only in one language
K. I do not program at all

3. Of the C languages you have used (if any) for the Atari 8-bit, which do you consider to be the most usable?

A. Deep Blue C B. Lightspeed C C. CC8
D. CC65 E. One not listed above
F. I have not programmed in C on the 8-bit Atari

4. What is the primary feature you would look for in a compiled language system?

A. Fast compile/link time B. Fast resulting code
C. Small resulting code D. A rich function library
E. Ease of use F. Unsure

5. What is the second most important feature you would look for in a compiled language system?

A. Fast compile/link time B. Fast resulting code
C. Small resulting code D. A rich function library
E. Ease of use F. Unsure

6. In your opinion, what has been the major fault in compiled languages on the Atari 8-bit computer system?

A. Total compile/link time B. Resulting code execution speed
C. Size of resulting code D. Function library not complete
E. Functions not fully developed F. Too complicated to use
G. Unsure

7. Because of the limitations of the standard 6502 stack, some limits or options have to be taken concerning stack use. Which of these options do you feel is the most acceptable?

A. Limit the number of bytes passed as parameters to 16 or so
B. Pass parameters on a pseudo-stack
C. Pass parameters in a fixed memory block
D. Unsure

8. Many people have requested larger variable types be offered, what do you feel is the most apropriate (non-floating point) type?

A. INTeger (16-bits) B. EXTended integer (24-bits)
C. LONG integer (32-bits) D. BOTH 2 and 3
E. Unsure

9. What do you feel about floating point support?

A. Support Atari 48-bit BCD format
B. Support ANSI 32-bit format (FLOAT)
C. Support ANSI 64-bit format (DOUBLE)
D. No floating point needed
E. Unsure

10. An overlay linker allows you to section off large programs into smaller blocks, which only one block is visable to the processor at a time. This requires disk caching, bank switching or other means to select an 'overlay' to use at any given moment. Which of the following do you feel is most apropriate?

A. Support XE type banked memory for overlays
B. Support disk caching for overlays
C. Allow the user to select either one
D. Overlays are not necessary
E. Unsure

11. What is the largest amount of memory on any single Atari 8-bit computer you currently own?

A. 16k B. 32-48k C. 64k D. 128k
E. 400/800 with over 48k F. XL/XE with over 128k

12. Do you normally use a RAMDisk when developing code?

A. Yes B. Not available on my machine
C. No D. Unsure

13. Do you own a Turbo-816 upgraded machine?

A. Yes, no expanded/explicit memory
B. Yes, with 32k-64k of expanded/explicit SRAM
C. Yes, with over 64k of expanded/explicit SRAM
D. No

14. If you own, or are considering owning a Turbo-816 upgrade, would you be interested in a native mode development package?

A. Yes, I would be interested
B. Would consider a T816 if there was such a package
C. No, not interested
D. Unsure

15. Do you own another type of computer system? If you own more than one, the system you use most often.

A. Atari ST B. Commodore 8-bit C. Amiga
D. Macintosh E. Apple // F. MS-DOS Compatible
G. No other system

16. What disk operating system would you normally expect to use with a C development system?

A. Atari DOS 2.x and Clones B. MYDOS
C. Disk Based SpartaDOS D. SpartaDOS-X
E. OSS DOS+ F. Other DOS
G. Unsure

17. What is the largest capacity drive (not counting any RAMdisks) on your system?

A. Floppy, under 175k B. Floppy, 175k to 199k
C. Floppy, 200k to 399k D. Floppy, 400k or more
E. Hard Drive F. Unsure

18. Do you use an 80 column screen device on your Atari 8-bit for editing text files?

A. Atari XEP-80 B. DataQue MV80
C. Other Hardware 80 column adapter
D. Software 80 column emulator E. No, only 40 column
F. Unsure

19. A source level debugger allows you to debug your executable program like other debuggers, but allows references to your original source code to be maintained. How should such a product be sold?

A. As a seperate product
B. As an integral part of the system
C. Both
D. Not needed at all
E. Unsure

20. A profiler allows you to optimize your code by providing information on how long various portions of your code take to execute, as well as how often they are executed. How should a product like this be sold?

A. As a seperate product B. As an integral part of the system
C. Both D. Not needed at all
E. Unsure

21. Many C compilers generate an intermediate assembly file which is assembled, rather than generating object code directly. What would your preference be?

A. Compiler generates assembly source
B. Compiler generates object code
C. User selectable at compile time
D. Offer two compilers, one for each type
E. Unsure

22. Would you prefer the C language system to contain an integrated editor?

A. Yes, include an editor B. No, it is not needed
C. Unsure

23. For a complete C language system containing a compiler, assembler, linker, debugger, profiler, and editor, what do feel would be a reasonable asking price for that product?

A. Free B. Shareware, under $20 C. $20-$30
D. $30-$50 E. over $50 F. unsure

24. What would be the media you would prefer a such a C language system to be offered on?

A. Cartridge B. Disk C. Either one
D. Unsure E. I would not be interested

25. Would you like to send written feedback at this time?

A. Yes
B. No

This concludes the survey. Thank you for taking time to reply.

USING 'USR'

8-Bit Programming Tutorial - Part 1
by John Picken
(Reprinted from the Puget Sound Atari News, August 1990)

When computer owners speak of "Machine Language" they usually mean "Assembly Language" (which is considerably simpler to learn). Though incorrect, I'll refer to Assembler as "ML" since it's common and convenient. Many people start learning it by reading a book on the subject, but all too often that's as far as they get. There are various reasons for this, one of the major ones being the perception that you have to start from scratch and write a complete and detailed ML program. ---- You don't.

ML is easier to learn than any other computer language because you can start by writing short routines for call from BASIC. The beauty of this approach is that your routines do not have to be long or complex to be useful. I hate learning a language by typing 10 PRINT "THIS IS A LINE"

Atari's USR function is one of the best ML interfaces among popular 8-bit BASICs. This article first covers the passing of data to and from a USR routine and how the routine can "find itself". Then it discusses and demonstrates programming and assembler techniques which can help you write USR routines that pack more power per byte.

One important pre-condition: a USR routine is not a stand-alone program but rather an extension to BASIC. This means that when writing one, you must keep BASIC's limitations and requirements in mind. For example, if

your routine is to be placed in a string, which is preferable, it must be relocatable and should not contain characters that require special treatment ([RETURN] and the quotation mark) -- remember the aim is to make life easier for the BASIC program.

HOW DO THINGS STACK DOWN?

Many BASIC's require a series of POKE's to pass values to a ML routine. Atari BASIC is much friendlier; you simply specify the variables, up to 26 of them, and BASIC pushes them onto the stack for you before entering the routine. The most important thing about these is that parameters are always numbers -- never strings. Since BASIC regards all numbers as floating point (FP) values, they get passed to the routines in ROM for conversion to two-byte integer. So no matter what value you pass, even 0, a parameter is always two bytes.

All these parameters must be cleared from the stack before the routine's exit to BASIC via RTS. Of course you don't pass variables just to clear them. To use them, you need to know that BASIC pushes the last one first. This means that parameters come off the stack in the order you put them in the USR statement. Equally important: BASIC pushes the least signifigant byte (LSB) first. This means parameters come off the stack MSB first. Note that this is the reverse of the order in which the 6502 pushes return addresses.

Finally, BASIC tells the ML routine how many arguments were passed. This value is the last item pushed onto the stack, is always a single byte, and is always there -- even if you passed no parameters. This accounts for the one disadvantage in the Atari BASIC USR implememtation: You can't call a ROM routine from BASIC, you always need at least one PLA which can only be done in ML.

A CRITICAL ADDRESS

The single, important address with USR is Floating Point Register Zero or FR0. It consists of six bytes starting at $D4 on Page Zero though we normally only need be concerned with the first two of them. FR0 is the primary address for passing data to and from the ROM FP package. It's always used when converting between ATASCII and integer. This means that if a value is to be passed back to BASIC, it would make sense to leave it at FR0 for ready conversion to floating point.

Not only does it make sense, it's what BASIC expects. BASIC always returns the floating point representation of whatever two-byte integer it finds at FR0 when you exit a USR routine. If you called the routine using X=USR(... then X will be assigned the value in FR0. If you programmed PRINT USR(... then the value in FR0 will be printed. Remember this is a two-byte value, so if you want the routine to return a meaningful value, you must store both bytes: FR0 and FR0+1. If you store neither, the address of the ML routine will be returned.

The other important aspect to FR0 is that to enter your USR routine, BASIC has to use FR0 to convert the address from FP to integer that can

be placed in the Program Counter. As it happens, the last value that BASIC converts, prior to entering a USR routine, is the routine's address. This neat little fact means that your routine can always know where it is -- the starting address is left in FR0.

EXIT BASIC

When BASIC encounters a USR statement within a program, it does a JSR to routines within the interpreter to handle it. This code, first, converts and pushes the variables and their count as outlined above. (Remember, the count is the number of two-byte values, so twice that many single bytes will have to be pulled.) After that, the routine's address is converted and left at FR0.

Finally, to enter the routine, BASIC executes a simple JMP (FR0). Since the routine is entered via JMP, the only return address on the stack is the original one buried under (above actually) the parameters. Once these are removed, RTS will take control back to the BASIC program.

As an example consider a routine held in ML$. Let RTB indicate the return address, and < and > indicate LSB and MSB. Assume also, the Stack Pointer is at $F2 when BASIC encounters X=USR(ADR(ML$),345,65500,7). Upon entry to the routine, the Stack Pointer will be at $E9 and low RAM will look like the following:

ADDRESS CONTENT COMMENT

$01FF ... Bottom of stack
$01FE ... Previous data on stack
... ... "
... ... "
$01F2 >RTB-1 <== Stack Pointer was here
$01F1 <RTB-1
$01F0 $07 <7 Param 3 LSB
$01EF $00 >7 " MSB
$01EE $DC <65500 Param 2 LSB
$01ED $FF >65500 " MSB
$01EC $59 <345 Param 1 LSB
$01EB $01 >345 " MSB
$01EA $03 3 parameters total
$01E9 ... <== Stack Pointer now here
... ...
$0100 ... Top of stack
$00FF ... Top of Page Zero
... ...
$00D5 >ADR(ML$) This is FR0+1
$00D4 <ADR(ML$) " " FR0

The routine has to pull seven bytes off the stack before getting to the return address. Keep in mind that the stack grows down from $01FF to $0100 and that the stack pointer indicates the next free spot in the stack. (This is different from some other microprocessors).

PROGRAMMING TECHNIQUES

Registers: Since you only have three internal registers, it shouldn't be hard to make use of all of them. If your routine is neglecting X or Y, it's probably wasting bytes. If you don't specifically need one, then keep it in a known state, such as one, zero, $FF, etc. Then you can use register transfers, increments and decrements to save bytes.

Direct Operations: Another important technique is operation directly on addresses (even hardware ones) using INC, DEC, ROL, etc. Direct address operations save time and space. For example, consider addition of one byte to a two byte total. Most programs use the method shown below left, but the code on the right uses fewer bytes and is faster, even if you need to add a CLC at the exit point.

```
CLC CLC
LDA TOTAL LDA TOTAL
ADC #VALUE ADC #VALUE
STA TOTAL STA TOTAL
LDA >TOTAL BCC EXIT
ADC #0 INC TOTAL+1
STA TOTAL+1 EXIT ...
EXIT ...
```

Page Zero: The 6502's treatment of Page Zero gives you, in effect, an additional 256 semi-internal registers. Consider the code below, assuming the labels define Page Zero addresses. The listing on the left uses ten bytes and 29 machine cycles while the code on the right achieves the same thing using two more bytes. The code on the right, however, uses only 18 machine cycles and has a major advantage -- you can access the saved values in any order, at any time.

```
PHA STA ASAVE
TXA
PHA STX XSAVE
TYA
PHA STY YSAVE
... ...
... ...
PLA
TAY LDY YSAVE
PLA
TAX LDX XSAVE
PLA LDA ASAVE
```

So to shorten and/or speed up your routines: use all internal registers, operate directly on addresses, and use Page Zero. And with Page Zero, don't limit yourself to the few bytes that BASIC doesn't need. You can usually appropriate all the FP Page Zero RAM and often, depending on the routine, the i/o RAM at $15-$4B. Both sample routines use large amounts of the FP area without any problems. These techniques allow packing a lot of features into very little space -- the second example (disk) routine fits into only 280 bytes.

Maximize your use of loops to minimize RAM use. Available RAM is usually not a problem especially if the routine is held in a string -- the object here is to shorten and simplify the BASIC program. If the routine can be fitted into a single BASIC statement, you save, not only space, but also use of a variable, so you can program X=USR(ADR("h etc."))

When using loops, don't be afraid to stuff garbage into addresses that don't matter. For example, to set up an IOCB, you normally store data in seven spots between ICCOM and ICAX2. Each address requires five bytes of code (a LDA #data followed by a STA $addr), so that's 35 bytes. Using a loop and a data table, you can accomplish the whole effort in 20 bytes. Simply put zero (or anything) into ICSTA and ICPTL/H -- no matter what you put there, the OS will put what it wants in them later!

Two BIT Tricks: In my opinion, the only valid use for macro's in USR routines is to enhance readability; any other use results in wasted bytes and duplication of code. In the sample routines, readability is the reason for definition of the SKIPWord macro (really a BIT instruction).

To understand the BIT tricks, consider an example where you want to change the X or Y register depending on your entry point to a common routine. If your code looks like the following, you achieve the desired result in very few bytes.

```
ADDR ACTUAL LINE LABEL MNEMONICS

6000 0100 *= $6000
6000 E8 0110 XUP.2 INX
6001 E8 0120 XUP.1 INX
6002 2C 0130 .BYTE $2C
6003 C8 0140 YUP.2 INY
6004 C8 0150 YUP.1 INY
6005 24 0160 .BYTE $24
6006 88 0170 YDOWN.1 DEY
6007 2C 0180 .BYTE $2C
6008 CA 0190 XDOWN.2 DEX
6009 CA 0200 XDOWN.1 DEX
600A 60 0210 EXIT RTS
```

If you enter at YUP.1 the following occurs: Y is incremented, a BIT test is performed on location $88 ($88 = DEY), another BIT test is done on $CACA ($CA = DEX), you exit having affected only the Y register and having saved several bytes for branches albeit at the cost of a little extra time. Remember always though, that BIT affects these flags: N Z V.

Beginning Stages: You will often find it easiest to program your routine in Turbo BASIC (using line labels) before putting it into ML. This way you can develop and test the algorithm before getting into the assembler. Remember you can include hex and bitwise logic with Turbo. When using this method, I suggest you restrict your code to one

statement per line, use line labels and avoid the use of IF. Since ML has no direct IF-THEN or IF-ENDIF equivalents, you should use ON-GOTO which translates more easily. Note that there is an advantage to ON-GOTO even in BASIC -- it can be used in multi-statement lines.

Comments: Comments don't cost anything in the assembled code, so don't be afraid to make ample use of them. The sample routines are extensively commented. This was not done for the sake of this article -- the comments were necessary to allow me to alter and add to the routines (in the case of the second one, over a couple of years). Remember that what seems obvious and clever today, can be incredibly obscure a month, or even a day, from now when you want to modify what you've done.

I suggest you keep your comments in lower case so they don't interfere when you want to use FIND or REPlace. If you keep the lines short (1 screen line), you can fit two columns of code on each page for printouts (use Elite print and a word processor to operate on an ASCII file). This makes debugging easier since you can examine twice as much code at a time.

Next Month: Part 2 will conclude with 'assembler techniques and tricks', and two example programs.

THE IDYLLIC LIFE OF A REVIEWER
==============================
by David Plotkin

This feature is a reprint from the OCTOBER/NOVEMBER ST-JOURNAL MAGAZINE, presented here by permission. THIS ARTICLE MAY NOT BE REPRINTED IN ANY OTHER PUBLICATION OR NEWSLETTER WITHOUT EXPRESS PERMISSION FROM ST-JOURNAL, 113 West College Street, Covina, CA 91723, 818-332-0372.

I've been involved with Atari computers for a long time - longer than most. I got into them strictly by accident when I attended the SF Computer Faire in 1980 and was fascinated by the many Apple II's. What really caught my eye were the games - I'd never seen anything like them except in the arcades, but I couldn't afford the humongous number of quarters that arcade machines were designed to gobble. Also, I couldn't afford to pay over $2,000 for an Apple II and a disk drive. A local computer dealer sold Ataris (yes, they really did in those days), and so, in May 1980, I plunked down $800 for an Atari 400 with 32K of memory and a tape drive. The dealer later admitted that he really made me a better deal than he should have!

I also bought Star Raiders which, to this day, remains one of the premier computer games of all times. About a month later, when I came up for air, I started looking around for something else to play. There was very little. I had violated the prime rule for computer purchase - buy the machine that will run the software you want to use. I decided to attack this problem in two ways. The first was to learn to program. The results of that effort were not very satisfactory because I was

using the Atari Basic graphics, etc. The results ran but were so slow as to be useless.

Magazine connection

The second line of attack was to start buying magazines. In those days, there were two magazines that covered the Atari: Compute! and Softside. These were similar - each had a section devoted to the multiple machines they covered. Type-in listings were featured, along with tutorials, and I read these avidly, painfully, learning the tricks of programming, as I went along, and playing the games that I had laboriously typed in. There were also advertisements for quite an assortment of software on tape-cassettes. I was in heaven - I quickly ordered a large selection of the more interesting looking stuff and soon discovered two things. The first was that most of this software was abysmal - slow, not much fun, and, after only a very short time, boring. It needed to be reviewed so that people didn't buy "blind" based on frequently misleading ads. The second thing I learned was that software (whether good, bad, or indifferent) is expensive. I couldn't possibly afford everything I wanted. So how was I to get all I wanted without having to pay for it?

Writers wanted

Being a relatively honest sort, stealing it didn't appeal to me. What I did was set myself up in the reviewing business. I phoned the editors of the magazines and explained that I could review software. All they had to do was send it to me - or I would be willing to phone the software company and ask for it to be sent to me directly on the strength of the assignment. Believe it or not, the editors were delighted. Finding someone who was at all familiar with computers and also who could write was a rarity. (I'm told that it still is to some extent.)

In all the years I've been writing, I'm proud to say that I've never missed a deadline - and there have been some pretty tough ones. Editors love that. Running a magazine is tough, and knowing that they have people they can count on is priceless. I have had calls asking for some major piece of software to be reviewed - with a deadline only a week away - and have pulled it off. This policy of being dependable has served me well down through the years with Analog, ST Log, Antic, START, Video Games, and now ST Journal.

A lot of people have seen me getting all this wondrous software free and have become convinced that I have it made. Well, it is pretty nice - especially since I get paid for the reviews, as well. But it's also a lot of work and carries a fair burden of responsibility. You see, along with all the good stuff like WordUp and Touch-Up, LDW Power and Dungeon Master, there is some really awful stuff - the kind you wouldn't waste your time with; you'd either reject it, after a short trial in the store, return it to get your money back, or just reformat the disk and kiss your investment goodbye. I can't do that. I've been assigned to

review it and that's my job, as unpleasant as it sometimes can be. A good example is my currently working review of STEVE, the ST Event Editor. This is integrated software; word processor, database, desktop publishing, and a few other things all put together into one huge package with a 600 page manual. The software isn't bad, just huge and not particularly interesting. But I can't just put it aside for some other time - I've got to get a review out on deadline. If I don't, my credibility suffers.

Responsibility enters the picture because I am relatively well known. It has been a long time since I have called a software or hardware manufacturer to request a review copy and they haven't known who I am. When I write a review, people listen and make buying decisions based on what they read. Since ST Log folded, my review may be the only one they see. What this means is that a lot of care must be put into evaluating the product. If, at first glance, it appears really awful, I must keep digging and evaluating to make sure I don't say it's awful without giving the software every chance to prove itself. One product (an alternate desktop) completely defeated me. I couldn't even get it installed. The files that I was supposed to work with weren't on the disk, and others that were not mentioned in the manual were present. After struggling with it interminably, I finally gave up. But I really tried far harder than if the software had been for my own use. Had I purchased it for myself, I would have simply mailed it back and gotten a refund. (Always buy software with your credit card because you can get your money back if it turns out to be unsuitable.)

But I must remember that people are going to read what I say and factor this into their decisions. It's sort of daunting to realize that my single article may influence a substantial part of the income of a software or hardware vendor. So I have to be fair and impartial and do a thorough job with each review, and, on top of that, write well and provide interesting material for my readers.

So much for the idyllic life of a reviewer! As you can see, it's hard work and carries a lot of responsibility. See you next month. - DP

EDITORS DESK
============
by Ron Kovacs

It has been a month since the last release and we blame this on a few
matters not worth going into details about. We are however, building
a library of informative articles, so we should be able to start a
regular release schedule.

We welcome the new systems who have joined the Z*Magazine crossnet
conference and look forward to some interesting conversation in the
weeks ahead. If your FoReM ST board is not carrying the Z*Mag
conference, tell your sysop to send email to node 593 and request
it. The conference code is 10593 and of course the lead node is 593.
Pass this information along so a quick sign-up can take place.

Special thanks to Bob Smith for the newsletters which have been the
source for some of the articles we are publishing this week.

Z*NET NEWSWIRE
==============

MICHTRON GOES EAST PRESS RELEASE
Michtron's operation has been purchased by a software group from Newark,
Delaware. The new president, James A. Dorsman, has taken over full
operation of all technical support, development, and publishing. Other
support staff includes Douglas E. Mackall, Curtis S. Wayne, Richard E.
Lamb, and Scott R. Lahteine. Gordon Monnier, former president of
Michtron, will be consulting with the new firm to help make the
transition as smooth as possible.

Under Michtron's new management team, an aggressive and exciting new
product launch is being formulated. Michtron's existing product line
will continue to be sold and serviced with the usual expertise.
```

Michtron intends to continue distributing and servicing for the overseas publishers it has worked with in the past, and to seek out new products from home as well as abroad. For more information, or to be included on Michtron's mailing list, please call or write to: MICHTRON, INC., 3201 Drummond Plaza, Newark, DE 19711, 1-302-454-7946, 1-302-454-1403 (FAX).

At present we are working very hard to get things organized and working smoothly. Please bare with us a for a few weeks, until we have our customer support, BBS, and tech support put together. If at all possible, please submit any questions in writing to the above address for the next month or so. When we are completely operational, I will post another notice here giving the new BBS number. Thank you for your patience, and we look forward to serving you with the best customer support in the business in the near future. -- Doug Mackall, Michtron

MICHAEL KATZ LEAVES SEGA
ZNS (Dec 2) Michael Katz has stepped down as chief of game maker Sega of America Inc.'s consumer products division, a position he has held since joining a year ago. Katz was previously employed by Atari Corporation.

MOTOROLA SHIPPING 68040 CHIP
ZNS (Dec 2) Motorola recently announced that it has begun shipments of its 68040 microprocessor. Motorola introduced the state-of-the-art chip in March 1990 with expectations of large volume shipments by summer, bugs in the microprocessor forced the delay. The chip packs 1.2 million transistors on a tiny piece of silicon. The chip is expected to be in short supply for several months as Motorola attempts to fill a backlog of orders from several companies, including Apple, Unisys Corp. and NEC.

CONVICTED CRACKER APPEALING
ZNS (Dec 2) One of three Georgia men who pleaded guilty to illegally entrying BellSouth Corp.'s computers is appealing a portion of his sentence that prohibits him from using computers while serving his time. Robert Riggs was sentenced to 21 months in jail, while his associates, Franklin Darden Jr. and Adam Grant, were handed 14 month jail terms, half of which may be served in a halfway house. Parts of the sentence have some people concerned, Riggs, Darden and Grant were ordered to pay $233,000 each to compensate BellSouth for injury to network and to help pay for repairs.

NEW COMPUTER CHIP
ZNS (Dec 2) NMB Technologies announced the availability of its new AAA1M300 series 1-Mbit CMOS DRAM at 60ns. The high-speed design supports direct access with 16-MHz microprocessors, eliminating the need for cache memory and allowing designers to create true zero wait state systems. Pricing for the 1-Mbit 60ns DRAM is approximately $5 per unit for quantities of 10,000. For further technical and pricing data, contact Tony Takeshita, NMB Technologies, 9730 Independence Ave., Chatsworth, CA 91311, 818-341-3355.

Z*MAGAZINE SPECIAL REPORT
ATARI AT FALL COMDEX 1990
---
by John Nagy

ZNS (NOV 26): Twice a year, the INTERFACE GROUP throws the biggest computer show the USA ever sees. It is COMDEX, with the Fall show in Las Vegas and the Spring show in Atlanta. This is where manufacturers meet the distributors and dealers who will buy the newest and best Computer products to put into their stores and catalogs. COMDEX is the computer re-sellers mecca. Atari was there, and so was the Z*NET NEWS SERVICE.

SUNDAY: November 11: It's setup time at the ever-more massive COMDEX computer exposition here in Las Vegas, Nevada. I visited the new show floor at the Sands Convention facility on Saturday afternoon to see the Atari exhibit being built. It is the largest floor area for a COMDEX that I have seen Atari have yet, with a mixed color scheme that clearly illustrated the differentiation of the Atari Personal/Home computer products from the Atari Business products. The Home area is accented by rainbow colored banners, rich in fluorescent oranges, while the Business area is a dignified Black and White.

Yes, the MEGA/STE is REAL, and I am writing this first report on one! The configuration is as predicted weeks ago in Z*Net, identical construction to the TT, although in Grey rather than off-White. It is NOT in production yet, and may see distribution in very early 1991.

At least five Mega/STe units are set up in the Atari booth, along with more than seven TT/030 units. All the Mega/STe units here on display are hooked to the new Phillips 14" color monitors, the STEREO SOUND units, model SC1435. This is VERY nice, large screen unit that will replace the SC1224 monitors completely, and should retail at or just above the current color monitor price (around $399 retail). It IS a step UP. The picture is every bit as good as the smaller screen units that preceded it, but comfortably larger. Full adjustments are offered (from the outside!) for picture size and centering. The internal sound is indeed stereo, but the amplifier and speakers are sadly no better than in the older mono units, leaving you to use external amps and speakers if you want the really clean, loud, distortion free sound that the new output of the STe series is capable of.

The TT's are almost old news by now after a year has passed from the COMDEX introduction in 1989. But today they are running the new SC1434 color monitors that offer the new TT resolutions ($450), and at least two are on the new Atari 19" monochrome monitors... VERRRRY impressive at under $1,000 each. The latest TT configuration, running at 32 Mhz with the new TOS and GEM NEWDESK, is expected to base price at nearly $3,000 (no monitor) for a four meg, fifty megabyte hard drive unit. Many developers are worried that this price is just too high to be competitive with the MAC II, available in similar (albeit slower) configurations for as little as $2,500. While "street price" of the TT may well match or barely beat the Mac II, there must be some additional

incentive for buyers to select against the MAC name and software base.

The REALLY bad news is... the TT has NOT passed the FCC testing, and so it is NOT ready for US distribution. Yes, Atari had promised that the TT would be shipping right after COMDEX, and the failure to have it ready is a major blow to both morale and sales impact at this pivotal show. There are now NO promises on WHEN the TT030 can be shipped, despite the hopeful words of "real soon now".

Attending third-party Atari vendors are quite dismayed, both to find that the TT will not be available, and also to find that a new machine has been "sprung" on them, as the Mega/STe was NOT announced even to developers. There are wide concerns that the new machine may cause new software compatibility headaches. Atari assures them that it will NOT.

In keeping with the business flavor of COMDEX, the "Home" part of the Atari booth is small... featuring twin setups of 1040STe units on modems for CompuServe and GEnie. It looks like the ONLY computer that Atari considers as a HOME unit now is the 1040STe. It may, in fact, become available to ALL dealers of any hardware or software if plans to place the 1040STe line with national distributors come to fruition.

Portfolios are all over the place, with hookups to a couple "alien" computers... a Mac SE and an IBM PS/2. It was a bit odd to see those computers in the Atari booth, but they are there to demonstrate connectivity with the palmtop Portfolio computer.

MONDAY: November 12: This Fall Comdex spans 2.2 MILLION square feet, and perhaps even MORE than 2.2 million SORE feet. The crowds are at least as large as ever, although there was much more traffic in the "established" convention halls than there was in the Sands Exposition and Convention Center (SECC), the brand new facility that helps make this Comdex 20% larger than any ever before. Unfortunately, Atari Corp is in the new SECC, and enjoyed less than throngs of people today. The traffic grew throughout the day, however, and most of us expect that the newness of the facility will wear off and that Comdex "regulars" will visit the hall later in the week.

The Atari exhibit looked even better today, with the last of the boxes and plastic carpet protectors put away, revealing further division between the "Home Computing" and "Business" areas of the booth. The Home area is about 20% of the booth, separated by a wide isle of burgundy carpet that exactly matches the regular isles. The visual impact is that Atari has two adjacent booths. I am told that at CES, the same concept will be used, with the proportions reversed.

Portfolio developers included XETORIX with their remarkable tiny hard drive, and IBP with PORTALOG, a mobile systems logging and analysis system for monitoring of environmental control systems, like huge plants or office buildings.

Atari itself showed their new FSM GDOS ("Font Scaling Module"), to be released this winter, perhaps as a freeware update to the world, perhaps

as a bundle with every new machine sold and some small fee to everyone else. This outline font technology updates the old and limited GDOS system to provide completely scalable and rotatable GDOS fonts. The outlines will be standard Ultrascript outlines, although from the IBM family of fonts rather than the Atari ST Ultrascript family. The added interchangability is probably worth the inconvenience to existing ST Ultrascript users. I played with the FMS system long enough to know that although it is even MORE complicated to install than the OLD GDOS, the power and versatility it adds to even simple printing programs is going to be worth every minute of effort.

On hand were Jack Tramiel, Sam Tramiel, Garry Tramiel, new General Manager Greg Pratt, and the Atari regulars including Bob Brodie, Art Morgan, Mel Stevens, Dan MacNamee, J.Patton, Don Thomas, Ceazar Dennis, Diana Goralcyzk, and the new guy, Bill Rehbock. Greg Pratt is younger than I expected, and is very approachable. His enthusiasm for Atari shows in every word... and Greg is no newcomer to Atari, having been head of the Financial division for some years. It looks like he must have reason for optimism. I remain ready to believe.

Yes, Atari looks GOOD at this COMDEX, and has more square footage in the largest hall of the convention than any vendor except JVC. While one developer observed that they wished some of the COMDEX show dollars were going to support the developer and dealer network, in a very real way, they ARE. Here at COMDEX, in the largest computer resellers convention in the world, ATARI is making sure that NO ONE thinks that ATARI is a second class manufacturer. THAT MATTERS, friends. Across the board.

WEDNESDAY: November 14: Tuesday brought larger numbers of visitors to the SANDS convention hall, the new facility that was comparatively lightly traveled on Monday. This brought crowds into the Atari booth, the largest and most central to the front doors in the entire hall.

Atari had some of the nicest literature on hand to date, fold-out color brochures for the "TT030 Graphics Workstation", the "Mega STe Business Computer", and the "1040STe Personal System". These were prepared by Marken and Associates, just recently re-signed with Atari after a less than dramatic stay with the advertising firm of Bob Thomas and Associates. Andy Marken was on hand throughout the show to help, talk, and learn more about what the users seem to want to know. That can only help in his efforts to promote Atari products.

While many of the passers-through were most intrigued by the rows of Portfolio palmtop computers, others were interested in what they perceived as a "more advanced Macintosh" environment. Still others knew of Atari "way back" and wanted to know what these new machines could do. We won't get a real report of the true effectiveness of the Atari presence at Comdex until (or IF) we hear what kind of numbers of dealer inquiries and distributor contracts are made.

Openly discussed by sales representatives and exhibitors was the possibility/likelihood of placing the 1040STe line into the major

distributor channels, making them as easy for any dealer anywhere to buy as any given software title. Pricing would become uniform for any quantity, and delivery would be out of Atari's hands. While this idea has a great deal going for it, Atari has concerns over possible abuses of the plan, such as distributors or dealers "unbundling" bundles of hardware and software for the purpose of selling it separately for more total income.

Bundles? Yes, there are at last approved Atari bundles for fourth-quarter distribution and promotion. There are still several to be approved, mostly including games and leisure software, but here are the ones that are a go so far. Remember, the prices here are SUGGESTED RETAIL.

520STFM HOME ENTERTAINMENT PACK: 520STFM, Missile Command, Star Raiders, Crack'd, Moon Patrol, NEOChrome, Joust. Retail: $579.65

520STFM COMMUNICATIONS PACK: Computer, SX212 modem, STALKER and STENO telecommunications software. Retail: $529.85

1040STE HOME PRINT SHOP BUNDLE: Computer, MIGRAPH HAND SCANNER, Touch-Up, Easy Draw 3.0. Retail: $1,398.90

1040STE DELUXE PAINT PACK: Computer, ELECTRONIC ARTS DELUXE PAINT ANIMATOR. Retail: $799.90

DTP PACKAGE #1: Mega 2 computer, SM124 Mono Monitor, Megafile 30 hard drive, SLM605 Laser Printer, CALAMUS. Retail: $2,199.00

DTP PACKAGE #2: Mega 2 Computer, SM124 Mono Monitor, Megafile 30 hard drive, SLM605 Laser Printer, DESKSET II. Retail: $2,099.00

PORTFOLIO PC TRAVELER: Portfolio computer, File Manager ROM card, PC CARD DRIVE, and 128K Memory Card. Retail: under $500.

New SC1435 COLOR MONITOR, 14" screen, STEREO SOUND, swivel/tilt stand. Retail: $399.00

If any of those prices sound a bit high, remember that Atari is now offering about a good markup in their retail prices, so dealers can either actually make some money OR offer great deals. Dealer costs tend to be about 66% of the retail, and street prices may be closer to 3/4 of the retail.

Late word is that the Portfolio may soon be in PRICE CLUB mass-marketing discount stores CHEAP. Dealers need not fear too much, since Price Club and other similar membership-oriented warehouse stores usually carry NO accessories, so dealers can pick up on the considerably more lucrative support market.

More promotion of the Atari Line came as a surprise to Bob Brodie, ISD's Nathan Potechin, and new Atari U.S. General Manager Greg Pratt on Tuesday night. The three attended the Beach Boys concert at Caesar's Palace as guests of the Beach Boys, longtime Atari MIDI users. During

the opening act, the comedian Andy Bumatai mentioned that he was a computer fan and that the Atari TT "just blew me away". He wasn't joking at the time, either. Later, during the Beach Boys set, Bruce Johnston of the band stopped the music and said that he had a dedication to make, despite dedications being "old stuff these days". He proceeded to explain that the little computer at the corner of the stage had performed flawlessly for three years, "saving their behinds" over and over. He finished by saying, "Atari, this one's for you", and the bad went into "Don't Worry Baby". The Atari table was totally surprised, and Greg asked Bob how he pulled that one off. Bob, as surprised as any of them, recovered enough to say "it was just a phone call..." Betcha Greg remembers Bob at Christmas...

WRAPUP

This is perhaps the longest review of a show I have ever assembled... and perhaps it should be. Although I left before the Friday close of the show, I know that I could have walked non-stop all week and NOT have seen MOST of the show. I did see the COMMODORE exhibit, a ways back in the same hall as Atari. It was perhaps 25% the size of Atari's area, but was filled with very dramatic video presentations on the Amiga machines. One, a real-time color video digitizer, was so good that it made our VIDI-ST pictures look like kids drawings. Of course, it was maybe 10 times the price... or more. But the crowds weren't there. Atari had lots more general interest. Much of it for the Portfolio.

There was LOTS of Atari to see and discuss at this COMDEX, although much of the discussion was less than a treat to participate in. The disappointments from Atari just keep coming. But the presence of Atari simply won't go away, either. Atari proves over and over that there is every reason to expect that the company can indeed produce the right machine at the right price. This time it is the Mega/STe. (My personal opinion of the TT030 is that it is too much money for what it delivers.)

The amount of money and effort that goes into a dramatic showing of best intent, as Atari has shown and spent at this COMDEX, once again has pulled many users and developers (and writers!) back from the brink of jumping ship. We hope that it will do the same for dealers and distributors of Atari hardware in the USA. That's what COMDEX is for.

SOUPING UP THE 1200XL

by Paul Smith

(Reprinted from the November 1990 Issue of the Mid-Florida Atari Computer Club Bulletin by permission.)

Those of you who like your 1200XL may have felt a little forlorn recently with all the nifty mods available for the other XL/XE machines. Well, help is on the way. I've had a chance to tear apart a 1200XL and "make it all it should have been." I'll describe the various mods available for those of you with enough know-how (or enough guts) to try.

PRINTER INTERFACES

Some of the "Apeface" style of printer interfaces won't work on the 1200XL. This is because they get their power from the computer. The power available from the 1200XL is not enough to drive these external devices. To fix this, short out R63. This is the 100 OHM resistor, (brown-black-brown), in series with the power supply and is located near the serial I/O connector (J1). Just solder a wire from one end of the resistor to the other. It is easiest to do this from the solder side of the board.

SERIAL I/O CONNECTOR

Connect together pin 4 and 6 of the serial I/O connector. These should be both connected together and then to ground. The 1200XL schematic shows these both connected, but on my machine only one was. As before, this is easiest to do on the solder side of te board.

CHROMA OUTPUT

As with the entire XL series, the chroma output has been left off of the monitor jack. This can be easily restored with the addition of a single 75 OHM resistor, (violet-green-black). Find the transistor Q7. Its emitter is soldered to the square pad, (the others are circular). On the solder side of the board, connect one end of the resistor to this square solder pad. Connect the other end of the resistor to the unused pin of the monitor jack (J2) through a wire of appropriate length.

XE-COMPATIBILITY

An XE-compatible 256K upgrade is possible. To perform this mod, remove R30 (near DRAM U5). Also lift up pin 12 and 13 of the PIA (U23) from the socket, (with this mod, you lose the use of the two LED's on the fromt panel). Remove the 8 DRAMs located along the front row of the PC board. Build up the circuit with the following parts:

UA - 74LS393
UB - 74LS153
UC - 74LS151
UD - 74LS10

Since the shield is low, the piggyback technique cannot be used. Nor is there much room for a small PC board. I hand wired the parts by placing the IC's upside down on the top side of the board and soldering from leg to leg. When connecting the circuit, pin 1 of the DRAM is the hole left by R30 nearest DRAM U5. Left pin 9 from U10. This is to be connected to one end of R97, the other end should be connected to pin 6 of the new 74LS151 (UC). To test this modification, run any of the programs written to utilize the 130XE extra memory. Better yet, try running one of the RAMdisk programs available for the 256K 800XL.

TRANSLATOR

It is possible to re-program the OS sockets to accept 2764 EPROMs. This will allow you to have built-in translators installed in your machine.

To perform this modification, locate jumpers W6 through W13. They must be set up according to the following label. Note: W10 is not used for this - it is used to program the GTIA for US or European TV standards.

JUMPER ROMS EPROMS
------ ---- ------
W6 IN OUT
W7 IN OUT
W8 IN OUT
W9 IN OUT
W11 OUT IN
W12 OUT IN
W13 OUT IN

With these modifications installed, you have brought your machine up to the state-of-art, (although it is still a little large). It should be able to take on all comers.

USING 'USR'
==========
8-Bit Programming Tutorial - Part 2 (Conclusion)
by John Picken of GCACE

(Reprinted from the Puget Sound Atari News, September 1990)

Editor's Note: Please refer to the August 1990 issue of PSAN and Issue #186 for Part 1 of this article.

ASSEMBLER TECHNIQUES AND TRICKS

This section is written with reference to MAC/65 and will obviously apply in only varying degrees to other assemblers.

Use some form of standard header which can be ENTERed before or after you start coding. It saves typing, ensures you don't forget things, and makes it easier to classify and file your code. You can include SAVE statements after semicolons and space the lines so the cursor ends up on the appropriate one each time you hit [RETURN]. Then just [SPACE] over the line number and semicolon and press [RETURN] to save. Note that's "tatement" with an "s" at both ends -- working out of RAMdisk is convenient BUT just kick the wrong cord when you've got an hour's worth of work saved to the RAMdisk only!

I follow the header with syntax and parameter instructions as well as a description of routine returns. These are started before coding, but are updated and revised as ideas occur or difficulties arise during the actual writing. In this way they serve as a kind of program specification to work toward and as "DOC's" when done. In the same area, when assigning variables, the *=*+ trick saves a lot of typing each time you want to insert or change one -- just be sure FR0 ends up where it's supposed to.

Don't overlook the flexibility offered by MAC's TEXT mode and the PRINT option. In TEXT mode, you can ENTER and edit anything including LISTed BASIC. You can also REPlace semicolons in ML with periods, LIST to disk, and then ENTER the lines as REM's directly into a BASIC program.

If you want to reorganize a program, it is often easiest to PRINT to disk to kill the line numbers and then reorganize using a word processor. Then you can use the ENTER #Dn:... ,A option to get it back into MAC/65 which will supply new line numbers. These techniques are so convenient that I often use a combination of TEXT mode, PaperClip and line labels to work on Turbo BASIC programs. Once done, either PC or MAC can replace the labels with line numbers for use with Atari BASIC.

If code exceeds 250 or so bytes, many assemblers produce compound files which cannot be used in a string. An easy way around this is to assemble to RAM (somewhere around $6000) and use BSAVE. This has the added advantage of allowing you to work on the file with a monitor. Check the last few lines of both examples. The percent sign in the BSAVE line is used to indicate a line delete character [ESC] [SHIFT] [DELETE]. This causes the line to appear on screen as a command after assembly so all you have to do is overtype "LAST" with the address which appears above it.

TWO EXAMPLES

The best way to demonstrate technique is with short programs that serve real and useful functions. The first sample listing obtains a key press from a list of allowable keyboard codes. To avoid a series of IF-THEN statements or conversions, the routine returns the position in the list of the key pressed. This means a calling program can use ON-GOTO(SUB) or variable line numbers; for example:

```
ON USR(ADR(K$),k1,k2,k3) GOTO 100,200,300 or
GOTO 100*USR(ADR(K$),k1,k2,k3)
```

The second routine is a flexible and powerful disk access tool. It can form the basis for any number of programs since it includes some functions normally found in DOS. The program I wrote it for, uses it to (among other things) read SpartaDOS directories from BASIC while working under any FMS. This routine is an example of what I call "one bit programming". This means making use of individual bits, several flags, and every possible known condition to save bytes. FR0 is used to find the routine's address, loops are started so as to leave an index register set for subsequent operations, etc. BIT is used for the trick mentionned above as well as for its true purpose and, in conjunction with that, both the N and V flags are used.

THE FAT LADY SINGS

The sample routines are complex but worth working through. You'll discover numerous byte saving tricks, especially in the second. Of course you don't start by writing anything so difficult. Consider, for example, a routine to set your system defaults. For screen color and keyboard defaults, all you need to use are load and store instructions

though this is an excellent spot for loop(s). Setting things up this way is considerably faster (and more satisfying) than using SETCOLOR and POKE and, if you skip the PLA, the same code can be used as a SpartaDOS COM.

Like any other language, you learn assembler by doing; and the best way to start doing is with short USR routines. BASIC programmers who don't want to "do" assembler can still use the two example routines; I've included both in the form of LISTed BASIC lines in the file USRTUTOR.ARC for your intrepid editor to stick on a BBS. (You'll still have to look at the source code for the "DOC's".) Up here, in The Great White North, the file is on The Pothole BBS at 604-642-6795.

EXAMPLE 1

```
.TITLE "Get Key"
; Programmed by John Picken
; last revision: 20 Sep 89
; Syntax
;K=USR(ADR(KEY$)[,k1,k2,...,kn])
; k1,.., etc. are Keyboard codes
;
; Gets a key press and compares
; its keyboard code with a list
; of target codes. When matched,
; the key's position in the list
; is returned. Maximum allowable
; keys is 26 in Atari Basic, 27
; with Turbo. Keys are checked
; in the order passed so, if a
; code is passed twice, the 1st
; match is reported.
;
; If called with no parameters,
; the routine supplies defaults
; as if called for RETURN only.
; ESC always exits and returns 0
; BREAK is disabled until the
; routine exits to Basic.
;
; Equates and macros

EXAMPLE 2

```
.TITLE "SIO Utility"
; Programmed by John Picken
; last revision: 05 Oct 89
;
; A USR routine to access SIO.
; Syntax
;Status only
; S=USR(rtn)
;
;Status or Format
; S=USR(rtn,cmd)
;
;Read or Put/Write ops
; single sector
; S=USR(rtn,cmd,sec,buf)
; consecutive sectors
; S=USR(rtn,cmd,sec,buf,lim)
; trace file links
; S=USR(rtn,cmd+$80,sec,buf,lim)
; follow list of sectors
; S=USR(rtn,cmd,adr,buf)
```

```
; follow offset list of sectors
; S=USR(rtn,cmd,adr,buf,off)
; ____________________________
; 1st param is command: !"PRSW
;
; No other parameter is needed
; or accepted for Format. Since
; the routine checks status when
; called, the Status command is
; not needed but will execute
; correctly if used.
;
; If cmd is passed with the high
; bit set (inverse P, R, or W),
; the routine reads or writes
; sectors by tracing Dos 2 type
; file links until a forward
; pointer less than 3 is found
; or until the limit in param 4.
; The trace assumes bits 2-7 of
; the forward pointer msb are a
; file number and ignores them
; (MyDos/TopDos style). This
; limits it to sectors 4-1023.
;
; The high bit of cmd is simply
; ignored on format or status.
; ____________________________
; 2nd param is sector number of
; the starting (or only) sector.
; or
; If greater than 1279 (msb 5+),
; this param is taken to be the
; address of a string of sector
; numbers in 6502 order. This
; string must end with two zero
; bytes. This is the format used
; by SpartaDos in map sectors
; from byte 4 on (bytes 0-3 are
; previous & next map pointers).
; ____________________________
; 3rd param is buffer address.
; ____________________________
; The msb of the 4th param is
; always ignored.
;
; This param is total number of
; consecutive sectors or maximum
; traced sectors to do. Since
; the longest possible buffer
```

```
; string is 32767, the routine
; will not allow more than 127
; double density sectors.
; or
; If operating on listed sectors
; this is the offset in sectors
; counting from 1. eg. to start
; with the ninth sector in the
; list, this param would be 9.
; The routine uses 2*(offset-1)
; for indexing so it is limited
; to 128 sectors. For greater
; offsets, adjust the string
; address in param 2.
; ----------------------------
; Default parameters
; Drive and timeout may be
; altered by string assignment:
; Sio$(8,8)=CHR$(DUnit)
; Sio$(13,13)=CHR$(DTimlo)
;
; The routine sets DBytlo/hi
; based on the status call but
; always uses single density
; with boot sectors.
; ----------------------------
; Returns
; The routine reports SIO status
; via FR0. Error 168 is used for
; a parameter error. Error 255
; indicates an attempt to access
; more than 127 DD sectors.
;
; Following sector operations,
; the number of successful ops
; is PEEK(208) and the final, or
; abort, sector number is left
; in Daux1/2 (778-779)
;
; The status frame is left in
; Dvstat (746-749).
;
.MACRO SKIPW

3503. Atari in a PC Case (Hardware Mod.)

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-08 02:39:10 UTC
From: fseipel@hpuxa.ircc.ohio-state.edu
Message-ID: <1990Dec8.023910.14904@magnus.ircc.ohio-state.edu>
Source record: 114457

This is another text file I had laying around.. If you'd like to see more, please E-Mail me. I think this file is formatted to be output to a printer.

ATARI---->PC Conversion Page 1

THE FOLLOWING INFORMATION IS PRESENTED TO ASSIST THOSE INTERESTED IN CREATING A CUSTOM ATARI COMPUTER SYSTEM IN AN IBM 'PC' CASE. IT IS BY NO MEANS MEANT TO SERVE AS A COMPLETE DESCRIPTION OR 'HOW-TO-BOOK' ON THE SUBJECT AND IT IS ASSUMED THAT THE PERSON WHO UNDERTAKES THIS PROJECT IS WELL VERSED IN BUILDING ELECTRONIC PROJECTS. THIS INFORMATION IS PRESENTED BY MICRO SOLUTIONS FOR USE IN THE PUBLIC DOMAIN.

>>>SPECIAL NOTE:MICRO SOLUTIONS WILL NOT BE HELD RESPONSIBLE FOR SPONTANEOUS MELTDOWN OF YOUR COMPUTER OR PERIPHERAL EQUIPMENT DUE TO THE UNDERTAKING THIS PROJECT.

So you want to put you're ATARI into a 'PC' CASE....

Basically what's needed is: A thorough understanding of basic electrical circuits, soldering skills, some mechanical ability, and of course an IBM style case to your liking. These cases have become quite popular and are offered in numerous configurations. The main thing to remember when selecting one of these is, will your motherboard fit inside it without TOO MUCH modification? (Let's try to keep the SKIL saw in the closet for this project.) Another consideration, is whether or not you wish to have a HardDrive as part of this All-In-One system. Choosing an XL or XE computer makes this a much more viable possibility, because of the parallel expansion buss and the various HardDrive interfaces designed for this buss. Last, but not least, is the very likely addition of a TransKey board to enable the use of an external IBM style keyboard (well.... you know I had to say something about my product in this article).

Most of these 'PC' computer cases on the market also come with a fairly beefy switching power supply capable of running the Computer, extra RAM, Disk Drives, and various hardware enhancements. To fully take advantage of this built-in power supply requires some rewiring of many of the stock Atari power plugs and devices. To minimize some of this and to better utilize your storage media, it is recommended that XF551 drives be used in this project. The nice thing about these drives is the fact that they are really IBM type drive mechanisms in disguise, this allows for a simple bolt-in, no modification installation. The power connection on these drives will readly accept the supplied power connectors on the switching supply and the drives will give you 360K storage per disk with a suitable DOS (ie: MYDOS or

SPARTADOS). The XF controller (the PCB included with the XF551 drive) will need some slight modifications as follows:

1) After seperating the two halfs of the original XF551 plastic enclosure, unscrew the 4 screws holding the drive in place.

2) Unplug both the 34pin and 4pin connectors from the drive, then lift it out of the enclosure and set it to the side.

3) You will now find a couple of screws holding the PCB to the bottom of the enclosure. Remove these and lift the PCB straight up and

out.

4) Desolder the 34pin header (w/cable) from the PCB and replace it with an IDC style male header.

5) Clip off the 4pin female molex type power plug while leaving the connection wiring intact. Now replace this with a male 4pin IBM floppy power connector, being sure to matchup the PCB silkscreen designations with the proper pin numbers (pin1=+12vdc pin2=GND pin3=GND pin4=+5vdc).

6) Use a standard IBM drive cable to connect the drive to the controller card. These cables normally have two edge card connectors on one end, the END one is the one to use.

7) Now plug in power connectors from the switching power supply to the Disk Drive and also to the controller. The drive is now ready to use (be sure to set the drive select switches on the controller to the desired SIO #).

If you wish to use a 3.5" drive(s) in your system and wish to have them be capable of 720K storage, a complete kit and instructions are available from Innovative Concepts. If you don't require the full capacity, but would still like to use one of these smaller drives then the following instructions are for you.

3.5" Drive Conversion:

Using the controller as first modified, connect a 3.5" IBM drive in place of the 5.25" drive (this will usually require adapter plugs that normally come with the drive when purchased). No further modifications required.

Dual Media Drives from one Controller:

1) After performing the controller modifications already listed, turn over the PCB and locate pins 10&16 on the 34pin header. You will notice a trace connecting these pins together and another trace leading towards the center of the board from pin16. Cut the trace between pins 10&16 with an XACTO knife or razor blade, being sure to leave the other trace on pin16 intact (this is the drive select line

from the floppy controller chip).

2) Solder a wire from pin16 to the center of a SPDT toggle
switch.

3) Solder a wire from pin10 to one side of the switch and solder
a wire from pin12 to the other side of this same switch.

4) Plug the other unused 34pin edge card connector on the floppy
drive cable into the 3.5" IBM drive (this may require an adapter).

ATARI---->PC Conversion Page 3

Also, plug in a power connector from the switching power supply (this
may require an adapter as well).

5) The SPDT toggle switch will now select which drive will
respond off of this controller (either the 5.25" or the 3.5").
Pin10=Drive 1 Select, Pin12=Drive 2 Select, 34pin edge card END
connector=Drive 1, middle connector=Drive 2.

With this setup you will be able to use either the 5.25" or 3.5"
drive with but one controller. Both drives will be capable of 360K of
storage. Only one drive is usable at any given time from the one
controller (Disk duplication and/or copying between the two drives is
not possible). A second controller and drive will still be needed for
disk duplication and/or copying.

Computer Power Connection:

For simplicity, a 600/800XL or XE are the computers of choice in
this situation. The reason; only a single +5vdc supply is needed,
where as the earlier 400/800 models and the 1200XL required either
9vac or if bypassed; +5vdc, +12vdc, -5vdc. The +5 and +12vdc is readly
available off of the IBM switching supply, but the -5vdc or 9vac
isn't. You could of course kludge up some sort of supply to handle
this, but in the long run, the XL/XE's are better for other reasons as
well (parallel buss & built-in BASIC to name a few).

The 600/800XL and XE's use the same power connection plug, this
is a 7pin DIN (an 8pin DIN can be subsituted by removing it's center
pin). On this plug pins 1,4,6=+5vdc and pins 2,3,5,7=GND. Either cut
off one of the provided power connectors on the switching power supply
and subsitute a DIN plug or better yet, make up a 4 pin male floppy
power pigtail with a DIN on the other end. Only +5vdc and GND are
required on this connection.

Hard Drive Installation:

To install a HardDrive with high speed access will require an XL
or XE computer having the External Parallel Buss (often times called
PBI or ECI). It is through this parallel buss that a special drive
controller will be connected, offering an industry standard HardDrive
interface referred to as SASI or SCSI. To the best of my knowledge

there are currently three such devices available, the CSS Black Box, ICD's MIO, and Supra's Hard Disk Interface. Any of these is suitable for putting a HardDrive in your system, merely requiring the appropriate SASI or SCSI controller and drive.

If you're willing to sacrifice speed and if you can find it, there is an SIO connectable device that will give you HardDrive interfacing. It was called the ATR8000, actually a complete computer on it's own, which used the Atari as a terminal link. With the right

options, this Co-Processor board was capable of accessing HardDrives. Even without extra options, the ATR8000 would allow for connection of up to 4 IBM style Floppy disk drives, looking for the most part, as 4 Atari drives on the SIO port. It is also my understanding that higher capacity drives were possible through special configuration, allowing up to 1.2 MEG with the proper drive and DOS. There will be some problems with this interface, such as not 100% compatibility with all Boot Disks and/or DOS'es and very slow HardDrive access, otherwise it is a good alternative for 400/800 users especially.

Some of the other advantages to the parallel buss devices, is that they usually do more than just allow for HardDrive connection. To name a few; extra expansion RAM usable as a RAMDISK, RAM for Print Spooling, RS232 Port, Parallel Printer Port, and built-in Machine Language Monitor. Not all features are offered or are all available from any one device. The CSS Black Box is slated for a floppy drive interface enhancement, possibly similar in nature to the ATR8000,s floppy interface. This would give you an all in one drive controller that's also fast.

Most of the parallel interfaces will require some relocation in order to fit inside your 'PC' case. This amounts to fabrication of ribbon cable extensions in some cases, which may be as simple as using crimp-on connectors or as difficult as point-to-point wiring depending on the interface and computer choosen. My actual experience was with a Black Box and a 800XL computer. This was relatively simple, amounting to building a cable from one 50pin edgecard connector, one 50pin female IDC plug, and about 12" of ribbon cable. Both connectors were of the crimp-on variety, making for a no solder installation. When making your own cables, be sure to always line-up the pin#1's on both sides.

With the flexability of the interconnecting ribbon cable, you should be able to fit both the computer motherboard and the parallel interface board into most any 'PC' case. A little imagination is most useful in this task and good mechanical know how is imperative. Boards can be stood on end or stacked, just depends on the particular situation and alot on what you perfer to do. Find yourself a good supplier of mechanical spacers, fasteners, and PCB guides, because you'll be knee deep in them before your'e done with this project.

Power for your parallel interface can most likely be derived from one of the floppy power connectors on your 'PC' switching power supply. Once again it will require some rewiring of connectors and some good electrical sense. Power for the HardDrive and it's associated SASI/SCSI controller, will normally be as simple as plugging straight into one or two of the leftover floppy power connectors (by this time we may have exhausted all the available connectors, have no fear there are 'Y' adapters available).

Now comes a problem, most HardDrives need a few seconds to rev-up to full speed when first powered up. During this time they are not accesable from the controller and many times this can result in bootup

errors. One possible solution would be to provide a seperate power switch on the front panel for the Atari computer, switching it on after the HardDrive was up to speed. Another solution is something I came up with on my system, a computer power delay timer. This consisted of a 555 timer with it's trigger line tied to it's timing capacitors positive side, a 5vdc SPST relay on the output of the 555 with the common of it's coil and switch going to +5vdc, and the entire affair wired in series with the computer power line. Basically what happens is, that upon power-up, the timer's output will immediately go positive, thereby causing the relay to do absolutely nothing. After the timer times out (depends on the RC network used), the output will drop to GND causing power to flow through the relay's coil, pulling the switch closed, and allow power to go to the computer.

```
555
pin #s

+5VDC---[:::]--2-6--+)(---GND
220 47uf
K
1--------GND
+5VDC----------4
" ----------8
*RELAY*
+5VDC--[COIL]--3

*RELAY*
*SWITCH*
+5VDC----o/o-----[ATARI]--GND

+5VDC----[<]---3
1N4004
```

The idea is to pick an RC network that gives sufficient time for the HardDrive to rev-up, I found 220K for the timing resister and 47uf for the timing capacitor to be quite good for my Seagate drive (this gives about a 15 second delay). Increasing the resister's value will result in a longer time delay and decreasing it, will produce a shorter delay. It is also advisable to use a relay who's contacts are

rated for 1.5 amps, and for protection against arcing, solder a .01uf capacitor across the contact connections. Also, to protect the 555 timer from high EMF voltages that may be generated by the relay's coil, solder a 1N4004 diode across the coil with it's cathode (marked with a line) going to the +5vdc side.

Another rather nifty feature of this power-up delay timer, is that it offers an easy way to perform a ColdStart Reset for owners of the TransKey board (there I go again). To do this, take the Gray wire from the TransKey board, and instead of attaching it as suggested in it's original instructions, solder it to pin2 of the 555 timer instead. Now everytime you do a RESET from the IBM keyboard (attached to TransKey), you will shutdown the power to the Atari computer for

the duration of the time delay. This will of course result in a ColdStart Reset, just as if you had reached around back and shut off the computer's power switch and then turned it back on again. The main advantage is that you don't need a special O.S. or software routine to provide this keyboard coldstart reset.

Cartridge Port:

This is where things get alittle tricky....

How do you get access to the Cartridge Port once your Atari is tucked inside the 'PC' case? Well the best solution I have seen, is something that Bob Woolley from San Leandro Computer Club (SLCC) came up with.

Essentially what he did was to take one of those 34pin IDC edge card connectors (yes, the same one used for the IBM floppy drive cables) and with a little filing on the ends, he was able to insert this inside the plastic cartridge shrouding that came with the Atari motherboard (that's right you have to remove it from the board first). He then had a ribbon cable extending from this connector about 10-12 inches connecting to the Atari motherboard via a 34pin connector (this required desoldering the original cartridge socket & replacing it with wirewrap pins extending out the backside of the board). The completed assembly was then meant to be mounted behind a 3.5" drive bezel for insertion of the cartridge from the frontside of the 'PC' case. For more complete information with pictures on this modification, consult the May 1990 issue of the SLCC Journal. ***HINT: keep the ribbon as short as possible for reliable cartridge operation***

Conclusion:

There are of course many other things that can be put inside your new 'PC' case, but only you can decide what's best for you. Most importantly, plan out this project carefully before you purchase your 'PC' case and be sure to leave yourself sufficient room for future additions. (This will keep you from having to start all over again...

Yuck!) Most of all, have fun with your new ATARI PC and enjoy the looks of approval you'll get from those unsuspecting IBM'ers out there.

SUB: XE 300 MODEM

Well- I have this 300 Baud modem (I don't know why) and I haven't used it
for a while. Tonight I booted up my XE-TERM and when I tried to dial, I
got nothing, or rather a buzz. When I tried to use the voice phone, I heard
something unlike a normal dial tone AND our line was busy while the modem
was hooked up, even though it wasn't on-line.
The first thing I thought of was a short so I checked resistance on
the four conductor input of the phone line and found nothing peculiar.
Does any body else have any ideas.

Is there any program out there that will allow you to turn a boot disk into dos Loadable file. I have quite a few programs that I would like to put on my hard drive, but have yet to find a program that will do this.

I'm using Sparta 3.2d with a Supra Hard Disk

Thanks for any info

That depends on the HD interface. I believe the Black Box was supposed to let you put boot disks on partitions. If you are using the MIO, you might try keeping the Boot disk on the HD in .DCM format or something and then uncompressing it to a RAMdisk. Either way, there is a fair chance it isn't going to work. If a program doesn't even want to use DOS, there is a fair chance they will do other nasty things (like direct SIO calls or something.) I have managed to get some programs to boot from MIO RAMdisk, though. The PaperClip Spell Checker fits on there nicely, and a PD game or two work.

3508. Atari Archive News: Bart Changes

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-10 18:27:51 UTC
From: brode@math.lsa.umich.edu
Message-ID: <1990Dec10.182751.1410@math.lsa.umich.edu>
Source record: 114462
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Those of you who use the mail server, Bart, to access atari.archive.umich.edu will notice a few changes.

There is a new line in the message headers to identify whom a request come from. The X-Requested-By: line is useful for preventing some abuses of the path command.

The other change is in the Subject lines. They used to read "filename.arc.uxx". Now they ready "filename.arc - part uxx of uyy". This is to help people retrieve large files by parts.

I also made a few changes to make Bart friendlier to the host machine, but that's not of much direct concert to y'all.

The most frequent request for a new feature is to have Bart is to handle requests for large files differently. Currently, Bart rejects requests for files that would exceed the quota. Many feel that it would be useful for Bart to send out as many parts as possible.

Just a reminder, we don't have quotas to cause you grief, we have them to placate our system administrator. Please don't try to subvert our quota system. I know it isn't tough to do, but don't do it anyway. We've caught a few people doing it and sent them (and their Postmaster) a message on net.etiquette.

BTW, for those of you who are used to mailing me at "dyer@math.lsa.umich.edu" should take note that my account name has changed.

3510. Build a light sensor

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-11 23:17:13 UTC
From: fseipel@hpuxa.ircc.ohio-state.edu
Message-ID: <1990Dec11.231713.9465@magnus.ircc.ohio-state.edu>

How to make a Light Sensor
for the 8-bits

Kevin Jones

Atari Exchange of Louisville (AEL)

This is the first of a series of articles that will teach the average user a little more about his computer and the lesser known talents of the Atari computers. If this article meets with any interest then there will be more "How to" articles following this one. Each file will describe how to make a new hardware project for the Atari computers. If you like this article, have any questions, or just want to complain, you can reach me at The Atari Scene! (502-456-4292).

In this file I will describe how to make a Light Sensor. Before I get down to the details, I will tell you how it works. The joystick port for the Atari computer consists of 4 joystick input pins, 2 paddle input pins,1 negative ground pin, and 1 +5 volt pin. Right now we are only concerned with the paddle input and the +5 volt pin. The paddle works by a potentiometer that changes its resistance when the knob is turned. The ATARI measures this resistance and converts it to a number between 0 and 255. The light sensor will consist of a plug for the computer port, a potentiometer and a photocell. The Current will flow through the potentiometer,which is used to tune the potentiometer to a desired number,and into the photocell which will further change the resistance. From the eye, the current will go back into the paddle input pin on the computer. The photocell eye will change its resistance when light shines on its surface. It works somewhat like the pot but does not have a knob to turn.

Now that you have a minimal understanding of what you are making, we can begin to construct the sensor.

Here is a description of the port configuration on the computer.

1 2 3 4 5

6 7 8 9

1 to 4 Joystick input pins
5 Paddle B input
6 Fire button
7 +5 volts
8 Ground -
9 Paddle A input

Parts: (1) 9 pin Female connector 276-1538 2.49
(1) CdS photocell 276-116 1.79
(1) 100k potentiometer 271-1721 1.09
Wire-about Six feet

Step One: Cut the wire into two (2) strands of two feet each. Solder one end of the first wire to pin 9 and the end of the other wire to pin 7.

Step Two: Take the free end of the wire attached to pin 9 and solder it to one lead of the photocell. Next, solder a wire (new wire) to the other lead of the photocell and solder the end of that wire to an outside pin of the potentiometer (there will be three pins on the potentiometer).

Step Three: Take the wire from pin 7 and solder it to the inside pin of the potentiometer.

Step Four: Basically the sensor is finished. You can either mount it in a box or pc board, or you can tape the connections with electrical tape and let if flop around. I would tape it and mount it in a box to be neat and safe.

Making it work

All you have to do is plug the female plug into port one and run the below program. This program will print out the value (0-255) of the port. All that has to be done to measure the light is to obstruct the photocell and watch the readings. That is it!!

```
10 Rem Light Sensor Program
20 x=paddle(0)
30 print x
40 goto 20
```

That's about as simple as it gets.

Editor's Note: There are several potential uses for such a light sensor. Two ideas for BBS sysops come to mind immediately; one is immediate carrier loss detection (stick the photocell behind the CD light inside your modem). A second idea is to poll the photocell when a user types chat; if there is light in the room, the sysop is awake, so the BBS should ring the bell. Otherwise the BBS should display a message that the sysop is out/asleep.

I found out what was wrong with my xm 301 modem. The cable tv system was feeding back signals through my computer-through the modem- and to the phone line. It was a long process of taking the modem apart, taking the computer apart, and tracing the problem down to the back of my television.
Something to consider. I guess the ATARI switch boxes are only SPDT. If they were DPDT then the intereference from the cable line would not get through.

3513. Looking for weaving CAD programs for the Atari 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-12 19:43:29 UTC
From: marcotte@tdw231.ed.ray.com
Message-ID: <3618@sud509.ed.ray.com>
Source record: 114467

I would like to buy my wife a program for my XE computer to assist her in developing weaving "drawdown" designs for her loom. One that I know of is called "Weavemaster" from Macomber Looms in York, Maine. However, they used to sell a driver for the 1020 color plotter so the patterns could be printed out in color. Macomber Looms no longer sells this driver program and the guy who wrote it seems to have disappeared (Micheal Broos, last known address in N.J.).

Does anyone have any information on this plotting program, or weaving programs in general for the Atari 8-bits? I would really like to be able to get color printouts on my 1020.

Thanks for any help you can offer me.

Lou Marcotte

3514. Re: Viewing .GIF files

Newsgroup: comp.sys.atari.8bit

Brian,

I wrote a GIF viewer called APACVIEW. It's on GEnie and CompuServe,
and I've tried to get it uploaded here (are you there Ray?). It can
accept files as large as you can fit on your disk, as it doesn't need
to store the entire GIF file in RAM all at once. Let me know if you
can't find it anywhere. Be sure to get version 2.2.
